FOREWARD

In 2004, Connecticut became the first state to set a goal to reduce child poverty in half by 2014. Public Act 04-238 established a Child Poverty Council, charged with recommending strategies to reduce child poverty in the state by 50% within 10 years. At the time, 24% of Connecticut children lived in households with income at or below 200% of the federal poverty level. For those living in Connecticut's larger cities, the rates were much higher. In fact, in 2004 Hartford had the second highest rate of child poverty (41%) of any city in the nation with a population over 100,000.

Four years later, the Connecticut Association for Human Services reported on the State's 2014 goal of reducing child poverty by 50% in our paper, *Meeting the Child Poverty Reduction Target: Moving Families and the Economy Forward*. By that time, Public Act 06-179 had combined two of the State's Councils into the current body, the Child Poverty and Prevention Council. The Council expanded its original charge, to reduce child poverty by 50% and also to promote the health and well-being of children and families in Connecticut.

At the January 2008 meeting of the Child Poverty and Prevention Council, the Council adopted 12 priority recommendations for action, many of which reflect the indicators of well-being we have identified in this Data Book including promoting the Earned Income Tax Credit, early childhood education, high school graduation, and preventing teen pregnancy.

In 2009, the Council brought in the Urban Institute to develop an economic model to determine how

the implementation of various policy options would change the number of children living in poverty in Connecticut. In general, no recommendation *by itself* would result in a dramatic decrease in child poverty, but together, there are policies that can have a significant impact on the lives of Connecticut's low-income families. The Council's top three recommendations that were most likely to reduce child poverty in Connecticut were:

1. Increase enrollment in subsidized housing, energy assistance, and nutrition assistance;
2. Increase attainment of associate's degrees;
3. Guarantee child care subsidies.

Today, nearly ten years later, the number of children living at or below 200% of the federal poverty level in Connecticut has increased from 24% to 30%. During this final year of a ten year promise to reduce child poverty, the Connecticut Legislature and Governor should work diligently to implement these recommendations, at a minimum. As policy makers make hard decisions in light of a large budget deficit, the question should be asked: will the choices we make today reduce the number of children living in poverty in Connecticut tomorrow and in the days and years to come?

ACKNOWLEDGEMENTS

Many individuals, agencies, and organizations have come together to produce *Honoring Our Commitment: Building a Stronger Future for Connecticut's Children*, the 2013 Connecticut KIDS COUNT Data Book. We would particularly like to thank the staff of the Annie E. Casey Foundation for their vision and hard work to improve the lives of children and families and for their support of the Connecticut KIDS COUNT project and CAHS—Laura Beavers, Florencia Gutierrez, Jann Jackson, John Padilla, Mike Laracy, Beadsie Woo, and others.

We would also like to thank the Hartford Foundation for Public Giving for its many years of support.

Several Connecticut agencies have supplied us with data for this publication. We would like to thank Ajit Gopalakrishnan, Connecticut State Department of Education; Federico Amadeo, Connecticut Department of Public Health; and Peter Palermينو and Carl Theisfield, Connecticut Department of Social Services.

We would also like to thank the following for providing commentary: Dawn Crayco, End Hunger CT!; Mary Alice Lee, Connecticut Voices for Children; Jane McNichol, Legal Assistance Resource Center of Connecticut; Cyd Oppenheimer, CT Voices for Children; Sharon Taylor, Yale School of Public Health; Jamey Bell, Office of the Child Advocate; Elaine Zimmerman, Commission on Children; Jennifer Alexander, ConnCAN; Philip Tegeler, Poverty & Race Research Action Council; Jenn Vendetti, Nurturing Families Network; Susan Yolen, Planned Parenthood of Southern New England; and David Tompkins, Klingberg Family Centers.

Finally, we would like to dedicate this year's Data Book to Jude Carroll, former KIDS COUNT Director for her hard work on behalf of Connecticut's children.

CONNECTICUT TOWN POPULATION ESTIMATES 2010

CHAPTER ONE DEMOGRAPHICS

Population
Race and Ethnicity

Child Population & Race and Ethnicity

WHAT DO THESE INDICATORS MEASURE?

CAHS uses two demographic indicators, Child Population and Race and Ethnicity. The number of children and their percent of the total population living in each town are reported for children under age 6 as well as for those under 18. Children of Hispanic descent are reported in a separate category because the U.S. Census defines “Hispanic origin” as an ethnicity rather than a race.

WHY ARE THESE INDICATORS IMPORTANT?

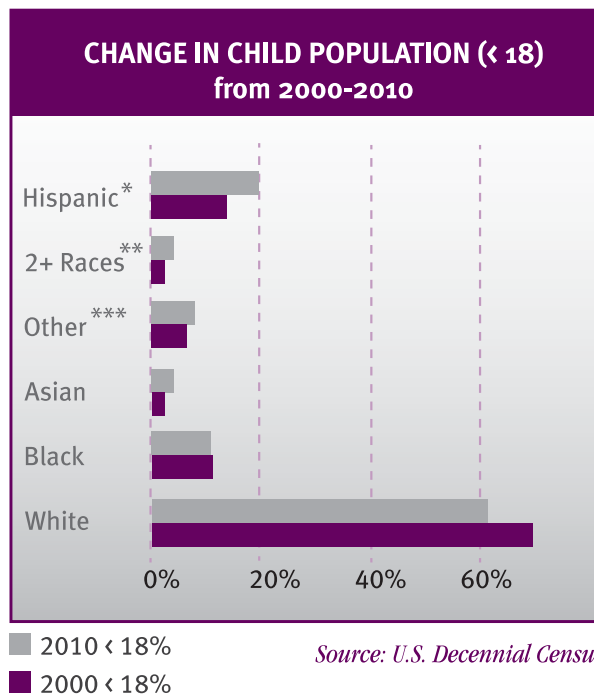

It is important to understand the size and diversity of Connecticut’s child population, compared to the entire population and by region, when thinking about strategies to improve children’s health and well-being.

DEMOGRAPHICS AND FAMILY ECONOMIC SECURITY

While wealth and opportunity exist within all races and ethnicities, far fewer Blacks and Hispanics than Whites are economically successful in Connecticut. Access to opportunity does not happen by chance. Certain federal and state policies have contributed to inter-generational income disparities by creating financial advantages for some and ignoring others. Although every town is home to some low-income people, historically Connecticut has been a state where poverty is concentrated in cities and inner-ring suburbs.¹

COMMENTARY

Between 2000 and 2010, Connecticut has increased its population by almost 5% (168,495). This growth was largely due to an increase in the adult population (>18); the number of children (<18) decreased by 3% (25,558). Slower growing cities and towns had proportionately larger declines in their child numbers. Of the eight major cities (Bridgeport, Danbury, Hartford, New Haven, Waterbury, Stamford, Norwalk, New Britain), only Danbury grew faster than the average growth rate (6%), and its child population increased by 5%. In contrast, Hartford, the slowest growing city (< 1%), saw its child numbers decrease by 12%.

Similar to many other states nationwide, Connecticut is more ethnically diverse than it was in 2000. While the White population in 2010 is 3.5% less than in 2000, Black (13.4%), Asian (6.4%) and Hispanic (4.9%) populations have steadily grown. These changes are even more pronounced for children (see chart). One other segment growing both in Connecticut and across the nation are people who identify by more than one racial group. As people are given the opportunity to check multiple boxes on the census form and not satisfied with choosing only part of their heritage, more and more people (including those declared Hispanic) declare multiple racial identities (e.g. Black and Asian, Hispanic and Black). From 2000 to 2010, their numbers increased by 25% to almost 70,000. Although this only represents around 2% of the state population, more rapid growth is evidenced in areas such as New London, Waterbury and Norwich where between 5% and 6% are in this group.

Sheryl Horowitz

Director of Community Research, Connecticut Association for Human Services

* Hispanics are their own group and not included in racial groups

** Includes individuals who declare multiple associations

*** Pacific Islander, Native Hawaiian, American Indian, and other races with low numbers

CHAPTER TWO

ECONOMIC WELL-BEING

Child Poverty

Care 4 Kids – Child Enrollment

Earned Income Tax Credit (EITC)

Temporary Family Assistance – Child Recipients

Supplemental Nutrition Assistance Program (SNAP) – Child Recipients

School Meals

Child Poverty

WHAT DOES THIS INDICATOR MEASURE?

The child poverty measure looks at children under the age of 18 who live at or below the federal poverty level (FPL) and children at or below 200% of the federal poverty level.

WHY IS THIS INDICATOR IMPORTANT?

Poverty is the single greatest threat to a child's well-being. According to the National Center for Children in Poverty, poverty can impede children's ability to learn and contribute to social, emotional, and behavioral problems. Poverty also can contribute to poor health and mental health.²

CHILD POVERTY AND FAMILY ECONOMIC SECURITY

As we have noted, much of Connecticut's poverty is concentrated in cities. Research shows that children who experience poverty when they are young and/or experience deep and persistent poverty are at greatest risk.

COMMENTARY

Connecticut has done much to blunt the recession's effects on children, yet we're still confronted by some troubling numbers. Among them: the percent of Connecticut children living in households that earn less than 200 percent of the federal poverty level (FPL) – a description that takes in not just the very poor, but also the working poor. The data collected by Kids Count shows that 25.3 percent of Connecticut children fell into this category between 2005-2009. During 2007-2011, the number rose to 26.7 percent, a total of nearly 116,000 Connecticut children.

We know that children of low-income families lag significantly behind their more affluent peers when it comes to academic, social, and even physical development. We also know that as adults, they may find severely limited opportunities in the workforce. It is estimated that each year a child spends in poverty costs society \$11,800 in lost future productivity. Child-poverty experts from a wide range of disciplines and viewpoints agree that turning this situation around requires investments in: 1) policies that boost family incomes and earning potential; 2) education; 3) the income safety net; and 4) family structures and support.

Our state's investments so far in early childhood programs, jobs, the Earned Income Tax Credit, and supported housing represent a good start. Still, we must triple our efforts—in spite of the current budget constraints. Once the full cost of child poverty is understood, it becomes clear that the best investment portfolio we can present to the people of Connecticut is one that uses proven policies to protect all Connecticut children from poverty. The dividend will be an improved quality of life for everyone, a more competitive economy, and a state that lives by its values.

Elaine Zimmerman

Executive Director, Connecticut Commission on Children

Child Poverty

Care 4 Kids – Child Care Subsidy Program

WHAT DOES THIS INDICATOR MEASURE?

The Care 4 Kids Child Care Subsidy Program indicator reports the number of children enrolled in the program by town in 2005, 2009, and 2012.

WHY IS THIS INDICATOR IMPORTANT?

Research shows that providing child care subsidies to both married and single mothers increases labor force participation and duration in the labor force compared to mothers who do not receive child care assistance.³

CARE 4 KIDS AND FAMILY ECONOMIC SECURITY

Working families with young children living in poverty pay 32% of their monthly family income on childcare, nearly five times more than families at 200% of poverty or higher. For single mothers, up to 41% of their monthly income can be spent on childcare. A childcare subsidy provides much needed support to families on their path to economic security.⁴

COMMENTARY

Not surprisingly, according to the 2012 Care 4 Kids data the highest numbers of families enrolled in Care 4 Kids are in Connecticut's largest urban centers: Bridgeport (2,151), Hartford (2,513), New Haven (2,144) and Waterbury (1,802). And in fact, the number of enrollees in each of these four cities is more than double the next highest town's number of enrollees—New Britain at 985.

What is surprising is that in Connecticut, there are only six towns that do not have any families receiving Care 4 Kids. This tells us that there are families across Connecticut making less than 50% of the State Median Income, the threshold for being eligible for Care 4 Kids,

and that families everywhere in our state struggle to afford childcare in order to work.

In some of Connecticut's outer ring suburbs, the number of families enrolled in Care 4 Kids is also high – 359 enrollees in Hamden and 202 children in West Hartford. And although a much smaller number, there are families enrolled in Care 4 Kids in some of the nation's wealthiest towns which happen to be in Connecticut, New Canaan (10), Darien (5), Westport (7), and Greenwich (86).

Care 4 Kids is a vital program that allows families the opportunity to work. Care 4 Kids funding for families whose earnings increase so they are making above 50% of the SMI is scheduled for elimination. Current law allows families to continue receiving Care 4 Kids until their income reaches 75% of SMI. This proposal creates a dangerous cliff that, as the data shows, will have negative consequences for families in nearly all of Connecticut's cities and towns.

Key SFY State Fiscal Year

Earned Income Tax Credit (EITC) Federal & Connecticut

WHAT DOES THIS INDICATOR MEASURE?

The Federal EITC measures the number and percent of tax filers receiving the EITC in 2009 and 2010 and the total dollar amount claimed. The Connecticut EITC measures the number of tax filers who received the EITC in 2011 and the total dollar amount claimed.

WHY IS THIS INDICATOR IMPORTANT?

The Earned Income Tax Credit (EITC) is a tax credit for low- and moderate-income working people. It encourages and rewards work as well as offsetting federal payroll and income taxes.

EITC AND FAMILY ECONOMIC SECURITY

Studies have found that the EITC encourages work, reduces poverty, helps families meet basic needs, and improves children's achievement in school and likely increases their earnings as adults.

COMMENTARY

2012 marked the first year we can evaluate the Connecticut Earned Income Tax Credit, passed by the legislature with the strong backing of Gov. Dannel Malloy in 2011 and applied to that tax year. The CT-EITC is 30 percent of the federal EITC, and available to all federal EITC filers.

Connecticut's Department of Revenue Services provided CT-EITC data for 2011, but IRS data lags a year behind,

so direct comparisons are not possible. 178,885 tax filers claimed and successfully received the CT-EITC in 2012. The average credit was \$601, with credits totaling over \$109 million.

197,690 tax filers received the federal EITC in 2011. It appears that more than 15,000 federal EITC recipients did not receive the state EITC, and maybe more, since the number of federal EITC filers generally rises from year to year. There may be several reasons, including that some of those eligible for the CT EITC did not file a state tax return because they did not know about the credit, and/or that CT DRS screening tools flagged incorrect or fraudulent CT EITC returns. CAHS and other advocates are working with DRS regarding its CT EITC screening and subsequent requirements, to help ensure that all eligible filers receive the CT EITC.

Jim Horan

Temporary Family Assistance

WHAT DOES THIS INDICATOR MEASURE?

Temporary Family Assistance (TFA) measures the annual number of children receiving cash assistance through the family welfare program in Connecticut towns.

WHY IS THIS INDICATOR IMPORTANT?

Under the welfare reform legislation of 1996, TFA replaced the old welfare programs known as the Aid to Families with Dependent Children (AFDC) program, the Job Opportunities and Basic Skills Training (JOBS) program, and the Emergency Assistance (EA) program. Instead, states now receive TFA as a block grant each year.

TFA AND FAMILY ECONOMIC SECURITY

The TFA participation rate provides us with information on one specific population of children in poverty. There is a time limit to receive TFA, however, so this number doesn't reflect those who were on TFA but are no longer eligible due to the time limit.

COMMENTARY

The data shows a very slight increase, 5.16%, in the number of children in families receiving cash assistance in the Temporary Family Assistance program between the 2009 state fiscal year and the 2010 state fiscal year. This is one of the rare times that there has been any increase since welfare reform was adopted in 1997.

Connecticut was in the grip of a severe recession during these years. The surprise is that the increase was only 5.16%. The small increase reflects the very restrictive rules in Connecticut's family welfare program for families in which the parents are considered able to work.

Generally, such families are limited to 33 months of assistance. This means that many families had used up their lifetime eligibility for assistance before the recession hit and could not turn to TFA for assistance. Nationally, TFA programs were unresponsive to the recession; Connecticut's program was one of the least able to respond with help for families in need.

It is notable that the parts of the state with the most concentrated poverty, Hartford, New Haven and Windham counties, show very small increases in children receiving TFA assistance, while Fairfield County's numbers jumped up.

Supplement Nutrition Assistance Program – Child Recipients

WHAT DOES THIS INDICATOR TELL US?

The Supplement Nutrition Assistance (SNAP) indicator reports the number of children under age 18 in Connecticut who received SNAP.

WHY IS THIS INDICATOR IMPORTANT?

SNAP is the only federal program that provides assistance to households based solely on financial need. The population of children who receive SNAP would likely be hungry without the subsidy.

SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM AND FAMILY ECONOMIC SECURITY

SNAP provides many households with their only major financial resource for food. It also acts as a cash supplement for families by freeing up other money for the purchase of non-food items.

COMMENTARY

The Supplemental Nutrition Assistance Program (SNAP) recipient numbers are fairly clear—there are across the board increases, both nationwide and in Connecticut. The number of households receiving SNAP assistance in the state has more than doubled from 2005 to 2010, and the trend line shows no signs of slowing down.

The increase for child recipients has been more modest, climbing 18% from 110,374 to 131,130. The largest increases have been in mostly rural counties, specifically in Tolland (74%) and Litchfield (51%) counties. Of the urban counties, Fairfield County (26%) saw the largest jump.

It would be easy to blame the increase on the great recession, slow economic growth and unemployment. A big part of this big jump on caseload, however, isn't from more people falling into poverty, but from expanded eligibility within the program. In 2009, the American Reinvestment and Recovery Act (ARRA – the stimulus bill) gave states the opportunity to raise the income limit for SNAP benefits from 135% of the Federal Poverty Line to 185%. This increased the number of SNAP eligible individuals in Connecticut by more than 200,000, opening the doors to the program to more families in need.

Although the Department of Social Services has struggled to cope with the additional demand, the SNAP program has actually worked as intended, serving as a critical piece of the nation's safety net and proving a crucial income support in trying times.

School Meals

WHAT DOES THIS INDICATOR TELL US?

School meals reports the number of children under age 18 in Connecticut who are eligible for free/reduced-price lunches and the percent they represent of the total child population of the state.

WHY IS THIS INDICATOR IMPORTANT?

This indicator is based on household income, providing complete meals based on free, reduced, and paid rates. The majority of school districts participate, giving some insights into where Connecticut towns stand based on household income.

SCHOOL MEALS AND FAMILY ECONOMIC SECURITY

Schools meals are provided by the National School Lunch Program, a program that school districts, not individual families, apply to. The school district is able to calculate a district wide need, giving a more complete picture of household income than TFA with individual application and approval processes.

COMMENTARY

Subsidized school meal eligibility is based on household income; therefore, eligibility rates directly reflect the financial situation or hardship of Connecticut families with children. Since 2006, eligibility for free or reduced-price (F/R) school meals has increased 7.6% across Connecticut, reflecting an increased need for food assistance for

families. Differences are observed across counties with New London County experiencing the largest increase, with a growth of 10.12%, and Tolland County showing the smallest with a 4.59% increase in eligibility.

While urban centers like Hartford, New Haven, and Bridgeport continue to have the highest rates of F/R school meal eligibility, suburban communities like Manchester and East Hartford are trending upward to levels closer to cities like Norwalk and Stamford. The dramatic increases in eligibility of all counties shows that the need for food assistance has grown in all communities regardless of socio-economic make-up. This is seen specifically in the higher eligibility rates observed in New London and Litchfield Counties, two counties with varying economies.

If a child is in a family receiving SNAP benefits, they are automatically eligible for free school meals. The 2009 adoption of categorical eligibility for SNAP/Food Stamps raised the income eligibility limit for SNAP from 130% to 185% of the FPL and made the program more accessible to more families, in turn creating increases in the number of families eligible for free school meals.

Additionally, the Connecticut State Department of Education and the Connecticut Department of Social Services have placed additional efforts behind improving the method by which families receiving SNAP benefits are automatically certified for free school meals. Referred to as Direct Certification, this process has been improved among agencies and enforced in communities, resulting in an increased number of students categorized as eligible for free school meals.

Overall increases in eligibility may be related to the decreased economic conditions of families as well as administrative efforts to improve the method by which families are considered eligible for free school meals.

Dawn Crayco

Deputy Director, End Hunger CT!

Prekindergarten Experience

WHAT DOES THIS INDICATOR TELL US?

Prekindergarten experience reports the percentage of kindergartners who had a preschool experience as identified by a parent at the time of kindergarten registration. Currently, the way that a preschool experience is defined is left open to the interpretation of the parent and/or the school and how the experience is characterized in a kindergarten entry form.

WHY IS THIS INDICATOR IMPORTANT?

There is substantial evidence that an achievement gap between Connecticut's wealthiest income and low-income children exists even before kindergarten and is substantially impacted by that child's birth-five experience, including preschool experience.⁶

PREKINDERGARTEN EXPERIENCE AND FAMILY ECONOMIC SECURITY

The benefits of a preschool experience are directly linked to the quality of that program. For many families in Connecticut, accessing high quality preschool is unobtainable because of a variety of reasons including costs, transportation, employment and other familial demands.

COMMENTARY

Extensive research has shown that providing at-risk children with a high-quality preschool experience is key to ensuring that these children enter kindergarten with the same level of skills and preparedness as their more advantaged peers. For this reason, we should be concerned that stark disparities continue to persist between our poorest and wealthiest school districts

in the percentage of kindergartners with preschool experience. The most recent year of data here, from School Year 2010-2011, shows that 94.9% of kindergartners in District Reference Group (DRG) A (Connecticut's wealthiest school districts) reported having a preschool experience, compared to only 69.5% of kindergartners in DRG I (Connecticut's highest-need districts).

But what is equally concerning is what this statistic does not tell us. It does not tell us whether those children who do report having a preschool experience were in an accredited or non-accredited program, nor the level or type of educational experience of their teachers. It does not tell us whether these children attended preschool for one year or two; whether they attended a single program or multiple programs; nor whether their attendance was continuous or fractured. It does not tell us how many days per week they attended nor the length of their school day. It does not tell us whether the preschool offered any kind of wraparound services nor whether the children took advantage of such services. It is critical that we collect better data on each of these factors in order to understand which preschool experiences are most successful at readying children for school, especially if we are considering expanding our subsidized preschool services, so that we can make the wisest investments possible.

Cyd Oppenheimer

Senior Policy Fellow, Connecticut Voices for Children

Connecticut Mastery Test

WHAT DOES THIS INDICATOR TELL US?

Connecticut Mastery Test measures the total number of 4th grade students tested in each town, the number who met goal, and the percentage who met goal based on the total number of 4th graders who took the test statewide.

WHY IS THIS INDICATOR IMPORTANT?

The 4th Grade Mastery Test gives a good indication of where children stand academically on their reading, writing and mathematics skills by town and how certain towns fair against each other. 4th grade achievement is a good predictor of life long success.

CONNECTICUT MASTERY TEST AND FAMILY ECONOMIC SECURITY

Connecticut ranks amongst the highest states on our 4th grade test scores, but when you look at test data by town, the scores tells a very different story. The test scores shine a light on Connecticut's extremely large achievement gap, which is stark in the state's cities and across towns.

COMMENTARY

The overall results from the Connecticut Mastery Test (CMT) and the Connecticut Academic Performance Test (CAPT) indicate signs of progress, but a deeper dive into the data tells a different story. When we disaggregate these results, they reveal large and persistent student achievement gaps in Connecticut. These gaps are evident on both state and national achievement tests. For example, the 2011 National Assessment of

Educational Progress (NAEP) shows that Connecticut's low-income and minority students score nearly three grade levels behind their white and middle class peers.

In the past few years, some urban districts in Connecticut have made some progress towards raising student achievement and shrinking these gaps. However, data from NAEP, CMT, and CAPT make clear that over the last five years, we have not made enough progress. In fact, at our current rate of improvement, it will take 40 to 60 years to close the gaps at the elementary and middle school levels, and more than 100 years to close the gaps at the high school level. We must accelerate the pace of improvement to ensure a bright future for children and for our state. We can't wait 100 years. We can't even wait 10 years. We must close the gap by 2020.

Make no mistake - closing the gap by 2020 will require a tremendous amount of hard work every day and every year. It will require bold and systemic change. And it will take a shared commitment to making reform work. Defining our path forward will not be comfortable or easy, but a challenge like this always seems impossible – until it's done.

Connecticut Academic Performance Test

WHAT DOES THIS INDICATOR TELL US?

The Connecticut Academic Performance Test, or simply the CAPT, is a state-mandated standardized test administered by the Connecticut State Board of Education that all public school students in Connecticut must take during their sophomore year in high school.

WHY IS THIS INDICATOR IMPORTANT?

In the CAPT, students are not compared to one another in terms of performance; rather, student scores are compared to performance standards related to specific learning outcomes or skills. State goals have been set for the areas of Mathematics, Reading Across the Disciplines, Writing Across the Disciplines, and Science.

CONNECTICUT ACADEMIC PERFORMANCE TEST AND FAMILY ECONOMIC SECURITY

The CAPT is the only assessment required of all public high school students in Connecticut. Therefore, it is an important accountability measure. CAPT results highlight Connecticut's extremely large achievement gap, which is stark in the State's cities and across towns.

COMMENTARY

While statewide CAPT reading test results improved from 2006 to 2011, in 2011, less than half of Connecticut's tenth graders were reading at goal level. Across Connecticut, the percentages of students reaching goal varied tremendously from a low of 9%

in New London to a high of 87% in Westport.

The state's three largest cities had dismal percentages of students achieving goal. Bridgeport and Hartford each have only 11% of students reading at goal while New Haven has only slightly more (16%) students reading at goal.

In the next ring of cities (besides New London), Waterbury is marginally better at 14%; other second tier city results are somewhat higher with Stamford at 34% and Norwalk at 40%. Inner ring suburban students reading at goal varies with East Hartford at 18%, Groton 31% and Manchester 32%.

From the 2011 CAPT data, student achievement issues are not limited to the state's urban centers or even its inner ring suburbs. Suburban and rural towns like East Windsor (29%) and Putnam (31%) each have low percentages of students reaching the CAPT reading goal.

The CAPT data shows that too many of Connecticut's high school students are not reading well enough to succeed in college or career.

Kathleen S. Guay

Director of Policy Research, Connecticut Council for Education Reform

Graduation Rates

WHAT DOES THIS INDICATOR TELL US?

Graduation rate measures a 4-year high school graduation rate for school districts in Connecticut.

WHY IS THIS INDICATOR IMPORTANT?

In America's 50 largest cities, only 58% of students graduate from high school. Among the most common reasons cited for dropping out of school are academic struggle, economic reasons, family responsibilities, and youth crime. Academic struggle is the number one reason students leave school.⁷

GRADUATION RATES AND FAMILY ECONOMIC SECURITY

Students who are unable to complete high school comprise about half of the heads of households on welfare, and many of these households are headed by women who were teenage parents. Over a lifetime, students who are unable to finish high school earn an average of \$200,000 less than their peers who graduate from high school and \$800,000 less than their peers who graduate from college.⁸

COMMENTARY

This data primarily reflects the Connecticut discriminatory practice of dividing children up into schools based solely on their town of residence, which locks in socioeconomic segregation created by state housing policy and local exclusionary zoning.

The data does not fairly reflect what is happening in the Hartford region, where this practice of separating children by town of residence was found in 1996 to be the cause of the unconstitutional conditions in the Hartford schools. The data does not reflect scores or graduation rates of the large number of Hartford children attending suburban schools, or the large number of Hartford children attending magnet schools run by CREC, Goodwin College, or other school districts. More than 7,000 Hartford children are now attending integrated magnet or Open Choice schools.

Not only are children in these schools achieving higher scores and higher graduation rates, but a 2009 peer-reviewed study concluded that, on average, racially diverse magnet high schools in Hartford have "positive effects on both math and reading achievement, interdistrict magnet middle schools have positive effects on reading achievement" and that the schools are also associated with students having positive "multicultural attitudes and inclinations."⁹

Key

- ** County totals are not calculated
- * The Cohort Count is determined at the end of the school year.
- 1 Four-year Graduation Rate is percentage of students who received a standard diploma within four years, including early and summer graduates out of the cohort.
- 2 Still Enrolled means students were still in school after four years.
- 3 Other category includes students who dropped out (including those who enrolled in a GED program), transferred to postsecondary education or have an unknown status.

CHAPTER FOUR

HEALTH

Late or No Prenatal Care

Low Birth Weight

Infant Mortality – (Ages Birth To One Year)

Husky A and B – (Ages Birth To 19) – Child Enrollment

Late or No Prenatal Care

Key

* Percentages for towns in which fewer than 5 incidents occurred during the reported time period are not calculated because of the unreliability of small numbers

WHAT DOES THIS INDICATOR TELL US?

Late or no prenatal care measures the number of births for which mothers received late or no prenatal care as a percentage of all live births in a town or county. Late prenatal care is defined as that which takes place after the first trimester of pregnancy. Percentages are calculated using the total number of births for which the status of prenatal care is known as the denominator.

WHY IS THIS INDICATOR IMPORTANT?

Mothers who receive late (defined as beginning in the third trimester of pregnancy) or no prenatal care are more likely to have babies with health problems. Mothers who do not receive prenatal care are three times more likely to give birth to a low-weight baby, and their baby is five times more likely to die.¹⁰

LATE OR NO PRENATAL CARE AND FAMILY ECONOMIC SECURITY

It can be financially challenging for a woman to obtain proper prenatal care. The cost of care and missed work time and pay make it hard for low-income women to take the recommended care of themselves during pregnancy.

COMMENTARY

Approximately 40,000 babies are born in Connecticut each year. In 2008 and 2009, this number dropped just under 40,000, paralleling a slight trend in lower birth rates nationally. Maternal and child health advocates are much less concerned with birth numbers than they are in birth outcomes. Birth outcomes such as gestational age at birth, birth weight, APGAR scores,

and the need for acute neonatal interventions are critical indicators of maternal and infant health status. Birth outcomes are directly related to the amount and quality of prenatal care. Negative birth outcomes can be mitigated by mothers' access to and utilization of early and consistent perinatal care.

Not surprisingly, data from the Connecticut Department of Public Health show our urban areas have the highest rates of late or inadequate prenatal care. In 2007, the highest percentages of mothers with late or inadequate prenatal care were in Hartford (28%) and New Haven (27%) but in 2009, those numbers have improved considerably (20% and 21% respectively). New Britain's data show an average of 22% of mothers having late or inadequate prenatal care with little change year to year. New London's numbers have stabilized after a sharp decrease from 23% in 2001 to 13% in 2004.

It can be assumed that women who are not receiving early and adequate prenatal care are unlikely to be enrolled in perinatal education programs such as childbirth education, infant care, and breastfeeding classes. Women are likely unaware of these important educational programs if they are not connected to a healthcare provider where class offerings are displayed and discussed. Targeted outreach is needed, particularly in urban areas.

Low Birth Weight

WHAT DOES THIS INDICATOR TELL US?

Low birth weight measures the number of births that are determined to be low birth weight and the percentage of all births that have low birth weight.

WHY IS THIS INDICATOR IMPORTANT?

Low birth weight is strongly associated with infant mortality, and the overall well-being of a society is reflected in the health of its infants. Low birth weight is the result of either premature birth (before 37 weeks gestation) or fetal growth restriction.

LOW BIRTH WEIGHT AND FAMILY ECONOMIC SECURITY

Women with low-incomes are at greater risk of having babies with a low birth weight because of their limited access to adequate healthcare and greater exposure to many of the risk factors associated with low birth weight.

COMMENTARY

In 2006, the state average of babies born with low birth weight (less than 5.5 pounds) was 8.1%. In that same year, counties higher than the average include New Haven County (8.5%) and Hartford County (9.2%). In 2006, the communities with the highest numbers of low birth weight babies include Hartford (294), Bridgeport (253), New Haven (205), Waterbury (180), Stamford (133) and New Britain (107).

In 2001, Connecticut's percentage of low birth weight babies was 6.9%. In 2004, it rose to 8% and remained at that percentage in 2005 and 2006. The total number of births in 2001 (42,341) was actually higher than in 2004 (38,631), 2005 (41,415), and 2006 (41,889). The Healthy People 2020 goal is to reduce low birth weight percentages to 7.8%

The Middlesex Family Advocacy Program in Middlesex Hospital's Maternal and Child Health Division has been successful in reducing the number of low birth weight babies. Middletown has a lower than state average percentage of low birth weight babies. In 2006, only 5% of babies were LBW, down from 8.3% in 2005. Perinatal outreach efforts may account for the positive change. The Middlesex United Way has been funding a Perinatal Case Manager position at Middlesex Hospital. The perinatal case manager has dedicated time to ensuring expectant mothers are connected to health insurance, prenatal care, and at least two additional perinatal services available in the community. During the 2009-2010 year, only one baby was born with a birth weight lower than 5.5, in fact, just under the threshold. Given the sociodemographics of Middletown, percentages closer to other urban areas are expected.

Infant Mortality

WHAT DOES THIS INDICATOR TELL US?

Infant mortality measures the total number of infant deaths and infant death per 1,000 live births.

WHY IS THIS INDICATOR IMPORTANT?

Infant mortality is an international measure of how well a society ensures the health of its people, particularly its women and children. The World Health Organization defines infant mortality as the number of deaths occurring in the first year of life per 1,000 live births. The United States currently ranks 30th in infant mortality rates among all industrialized nations.¹¹

INFANT MORTALITY AND FAMILY ECONOMIC SECURITY

Within the United States, disparities persist between populations. Infant mortality among African American babies is double, and in some places triple, the rate for whites. Despite decades of work to expand coverage and early access to prenatal care, the preterm birth rate in America remains high. Excess premature births and infant losses have enormous costs to our families, our health care system, our schools and our national prosperity.¹²

COMMENTARY

The rate of infant mortality as a whole declined from 1999 to 2002 and then spiked again around 2004 to

2006. Recent data from 2007-2009 show that most counties have increased since 2006 and continued to rise through the end of the recorded period.

Cities tend to have worse infant mortality outcomes, relative to suburbs. However, it is also useful to look at the data at a county level. The surrounding towns/suburbs sometimes have infant mortality rates proportionate to cities within the same counties. Therefore, it is valuable to look at trends on a county level. While Connecticut as a whole seems to remain relatively steady, counties like Hartford and New Haven have the highest infant mortality rates throughout the recorded time period.

The fact that the data show a rise in infant mortality in the most recent years captured is disconcerting. One would think that with technology improvements, a health indicator as basic as a thriving infant would not be a true health concern, but clearly it is.

This increase in infant mortality is important because it indicates that factors other than technological intervention contribute to Connecticut's public health. Social and behavioral indicators (e.g., poverty, drug use, chronic disease, etc.) need to be further examined to explain this pattern.

WHAT DOES THIS INDICATOR MEASURE?

HUSKY A provides comprehensive health services, including preventive care, doctor visits, prescriptions, emergency care, hospital services, mental health and substance abuse treatment, and dental and eye care to low-income children. The HUSKY A indicator measures the number and percent of all children, under age 19, who are enrolled in HUSKY A.

WHY IS THIS INDICATOR IMPORTANT?

When health problems go untreated in young children, a host of negative, long-term outcomes can result. From healthy nutrition and frequent pre-natal care to regular well-child visits at important developmental points-in-time and dental care, expectant mothers and young children require specific interventions that are known to produce positive outcomes.

HUSKY A AND FAMILY ECONOMIC SECURITY

Many people have lost, or never had, employer-sponsored health benefits. Low-income families, who have higher rates of chronic illness and disability than upper-income families, are less likely to have adequate health care benefits. Without health insurance, a medical emergency or chronic condition needing ongoing treatment can threaten the household's financial security.

COMMENTARY

During the recent recession (officially March 2008 to January 2010) and the ensuing slow economic recovery, publicly-funded health insurance has been very important for Connecticut residents who lost their jobs or employment-based coverage. In fact, the HUSKY Program has done just what it is designed to do, that is, provide coverage for children and families in every town who are unable to obtain affordable coverage on the job or on their own. Moreover, Connecticut has been so successful that the state received a \$5.2 million performance bonus from the federal government for increasing the number of children with Medicaid coverage.

Connecticut is currently facing significant budget deficits and rising program costs. Medicaid expenditures have gone up as enrollment has increased; however, children and adults who made up 76 percent of all Medicaid enrollees in FY2009 accounted for just 27 percent of Medicaid expenditures. Connecticut must look elsewhere in the budget for savings that will not disproportionately affect these low-income families. Furthermore, the state's investment in the HUSKY Program will pay off over time in terms of improved maternal health and birth outcomes, improved child health, and improved educational achievement.

CHAPTER FIVE FAMILY AND COMMUNITY

Teen Births (Ages 15 -17)

Substantiated Cases of Abuse and/or Neglect

Child Deaths (Ages 1 – 14)

Preventable Teen Deaths (Ages 15 – 19)

Teen Births

WHAT DOES THIS INDICATOR MEASURE?

The Teen Birth Rate is the average rate of births to girls ages 15-17. The rate is given per 1,000 girls.

WHY IS THIS INDICATOR IMPORTANT?

Births to teenagers are strongly linked to poverty and single parenthood. Teen mothers are much more likely to go on welfare than women who postpone childbearing.

TEEN BIRTH RATE AND FAMILY ECONOMIC SECURITY

Unless a teen mother has substantial financial, emotional and social support after the birth of her child, she and her baby are at risk of the negative effects of poverty a over the course of their lives. Nearly half of all women who become mothers before they are 18 years of age ever complete high school. This limits the mother's employment options, putting her at long-term risk of low-wage earnings.¹³

COMMENTARY

This data shows a continued trend that we have been seeing in the previous two to three years. There are a variety of factors contributing to the decline in teen pregnancy and births to teens. Studies, such as the Youth Risk Behavioral Study, show that teens are delaying the onset of sex, having fewer partners and using condoms more often.

Connecticut's school based health centers are also offering more reproductive health services on site, such as pregnancy and sexually transmitted disease testing as well as dispensing or prescribing contraception in some school districts. More teen women are getting intrauterine contraception (IUDs) and hormonal implants—and this trend will increase as more young people are covered by Medicaid expansion.

Teen Births (Ages 15–17)

Key * Percentages for towns in which fewer than five incidents occurred are not calculated because of the unreliability of small numbers

SFY State Fiscal Year

These methods are longer lasting, reversible and much more reliable than methods that require daily use or compliance.

There is some closing of the disparity between the birth rates of white teens and their Black/African-American and Latino counterparts—but there is still a large gap. In particular, Latina teen birth rates are often the highest.

Susan Yolen

*Vice President of Public Policy & Advocacy,
Planned Parenthood of Southern New England*

Substantiated Abuse and Neglect

WHAT DOES THIS INDICATOR MEASURE?

Substantiated abuse and neglect measures the rate per 1,000 children under the age of 18 where there has been a substantiated case of abuse or neglect.

WHY IS THIS INDICATOR IMPORTANT?

Children who experience abuse and neglect are at far greater risk of negative outcomes, including the close to 30% who will later abuse their own children, continuing the cycle of abuse.¹⁴

SUBSTANTIATED ABUSE AND NEGLECT AND FAMILY ECONOMIC SECURITY

Poverty is the single best predictor of child abuse and neglect. In addition, those who experience abuse and neglect as children are much more likely to experience a host of lifelong challenges, including poverty, in their adulthoods.¹⁵

COMMENTARY

Overall, the trend line for substantiated abuse and neglect has decreased since 2000. While there was a slight increase from 2008 to 2010 there has been a 40% decrease since 2000 and a 15% decrease since 2005.

From 2005–2010 the large cities (Hartford, Bridgeport, New Haven) experienced a 9% reduction, while the secondary cities (Norwalk, Waterbury, Stamford, New London, New Britain) experienced a 17% reduction. Inner-ring suburbs (East Hartford, Manchester, Groton, Bloomfield) saw an increase of

24%. This is the only data set not consistent with the overall trend and further review is needed as this was not a comprehensive listing of suburban cities. This finding is a surprise as there are no obvious reasons why substantiated abuse and neglect would trend higher in suburbs but lower in larger and secondary cities.

This indicator needs to be watched closely as we move from a network of services utilizing congregate care programs to one utilizing community based services. With the dramatic systems change we are experiencing we need to watch closely all indicators that will tell us whether or not the systems change is working.

David Tompkins

Vice President, Klingberg Family Centers

Key

* Rates for towns in which fewer than five incidents occurred during the reported time period are not calculated because of the unreliability of small numbers

WHAT DOES THIS INDICATOR MEASURE?

Child deaths measures the number of deaths to children 14 years of age or younger in a given town and the rate per 100,000 children.

COMMENTARY

(See joint commentary, page 62, *Preventable Teen Deaths.*)

WHY IS THIS INDICATOR IMPORTANT?

Two thirds of child deaths are preventable. Reduction of child mortality is the fourth of the United Nations' Millennium Goals.

CHILD DEATHS AND FAMILY ECONOMIC SECURITY

Removing financial and social barriers to accessing basic services, developing innovations that make the supply of critical services more available to the poor, and increasing local accountability of health systems are policy interventions that have allowed health systems to improve equity and reduce mortality.¹⁶

Preventable Teen Deaths

WHAT DOES THIS INDICATOR MEASURE?

Preventable teen deaths measures the total number of preventable deaths to teens aged 15 to 19 by town.

WHY IS THIS INDICATOR IMPORTANT?

Teenage mortality is an important public health issue because the majority of deaths among teenagers are caused by external causes of injury such as accidents, homicide and suicide—by definition all preventable.

PREVENTABLE TEEN DEATHS AND FAMILY ECONOMIC SECURITY

It is important to be able to identify where preventable teen deaths are occurring in order to tailor prevention efforts. Unfortunately, many of the preventable teen deaths are happening in Connecticut's urban centers, where financial strain and violence add unnecessary stressors to the lives of Connecticut's teens.

COMMENTARY

The 1997 – 2009 trend line showing significant overall decreases in child deaths (ages 1 -14) is extremely positive. Deaths in this age group are down across the state, in cities, suburbs and rural areas. However, child death rates in Hartford County, Fairfield County, New Haven County and New London County are significantly higher than in the other four counties of the state.

And for teenagers aged 15 – 19, the picture is all-around less positive. Although the teen death rate is also decreasing across the state, it is still significantly

higher than the child death rate in Connecticut. Further, the teen death rates for Hartford County and Windham Counties are actually increasing—that is, we have done worse during the period of 2002 – 2009 at keeping teenagers in those two counties from dying.

This indicator is important because, at a minimum, what adults owe to children-- through government protection, supportive communities and safe and nurturing families—is to help keep them alive to adulthood. The fact that children are still dying at the rates they are, and teenagers' rates of death are actually increasing in some communities, is a crisis alarm that should mobilize all of our best efforts around prevention and safety initiatives, public health interventions, safe communities strategies, and broad public education toward the common goal of keeping our children alive.

It is also critically important to examine the reasons for children's and teenagers' deaths, and any changes in those reasons over time. In this way we can determine what interventions during that time may have contributed to decreasing child and teenager death rates, and what interventions should be employed to halt the increasing rate of deaths among teenagers in two large counties in the state.

Covering the age range from birth to age 18, the Office of the Child Advocate's *An Examination of Connecticut Child Fatalities, A Ten Year Review*, January 1, 2001 to

January 1, 2011 (http://www.ct.gov/oca/lib/oca/Ten_Report_III_in_Publisher_Format_III.pdf) provides illumination and analysis of the numbers of deaths in five different categories: natural deaths, accidental deaths, homicide deaths, undetermined deaths and suicide deaths. Examining child and teenage deaths over this ten-year period allows us to surmise that some of the decreases in the incidence of these deaths are attributable to some important prevention measures during this time including graduated driver licensing laws and suicide prevention campaigns.

Jamey Bell

Key * Rates for towns with fewer than 5 incidents during the reported time period are not calculated because of the unreliability of small numbers.

SOURCES, METHODOLOGIES, AND SPECIAL NOTES

LIMITATIONS OF DATA

In any data collection process there are always concerns about the accuracy and completeness of the data that are reported. All data used in the Connecticut KIDS COUNT publications were collected through routine data collection systems operated by various state agencies and national organizations. We cannot control for the completeness of reporting for these systems.

MAP: CONNECTICUT TOWN POPULATION 2010

Source: U.S. Census Bureau, Decennial Census 2010 Table QT_PL.

Methodology: Total 2010 population estimates for each of Connecticut's 169 towns, color coded by population size.

CHILD POPULATION

Source: U.S. Census Bureau, Decennial Census 2000, 2010 Table QT_PL.

Methodology: Number of children less than 18 calculated by subtracting the number of individuals greater than 18 from the total population. The percent of the total population those age less than 18 represent. The percent change in child population is calculated by subtracting the number of children in 2000 from the children in 2010 and dividing by the number of children in 2000.

CHILD RACE AND ETHNICITY

Source: U.S. Census Bureau, Decennial Census 2000, 2010 Table QT_PL.

Methodology: For each racial and ethnic group the number of children less than 18 is calculated by subtracting the number of individuals greater than 18

from the total population. For each group the percent of the total population is calculated by the Census. The "Other" category combines the census Other category with groups of small representation in Connecticut including American Indian, Native Hawaiian, and Pacific Islander. Two plus races include individuals declaring more than one racial group, or as Hispanic and other race. Categories do not sum to 1 as individuals may report themselves in multiple categories.

CHILD POVERTY

Source: U.S. Census Bureau, American Community Survey 5 year estimates 2005-2009, 2007-2011 Table B17024

CARE 4 KIDS – CHILD ENROLLMENT

Source: Connecticut Department of Social Services, Bureau of Assistance Programs, unpublished data, SFYs 2005, 2009, and 2012.

Methodology: The annual unduplicated total number of children enrolled in Care 4 Kids, Connecticut's child care subsidy program, in a town or county. It should be noted that the annual unduplicated Care 4 Kids child enrollment numbers are larger than the numbers often reported by the Connecticut Department of Social Services. The Department typically reports the annual average rather than the annual total for the program.

EARNED INCOME TAX CREDIT

Source: 2009,2010 Federal data- The Brookings Institution EITC Interactive database. <http://www.brookings.edu/research/interactives/eitc>; 2011 State EITC data- from IRS via CT Voices for Children.

Methodology: Internal Revenue Service zip code level data (tax year 2007) were aggregated to the city/ town

level. Brookings data represents tax returns filed between January and June of the tax year.

TEMPORARY FAMILY ASSISTANCE – CHILD RECIPIENTS

Source: Connecticut Department of Social Services, Bureau of Assistance Programs, unpublished data, SFYs 2010 and 2011. Annual average town Statistical Report # DMF8019A-DMF8057I.

Methodology: The average number of children under age 18 receiving Temporary Family Assistance (TFA) benefits over the course of the year in a town or county. Eligible children include those in families where the parent(s) is enrolled in the employment focused, time-limited assistance program (Jobs First); has received an extension from the Jobs First program; or is exempt from the Jobs First program. (Exemption can be obtained if the adult is a parent who is incapacitated, is taking care of an incapacitated family member, or is a non-parent caregiver who does not receive assistance.) Children under 19 are eligible themselves to receive TFA as long as they are still in high school. Children between 18 and 19 years of age are not included in these TFA child participation numbers.

SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM (SNAP) – CHILD RECIPIENTS

(Formerly Food Stamp Program)

Source: Connecticut Department of Social Services, unpublished data, SFYs 2005 and 2010.

Methodology: The annual unduplicated number of children under age 18 participating in the federal Supplemental Nutrition Assistance Program, formerly Food Stamps, by town or county.

SCHOOL MEAL PROGRAMS

Source: Connecticut State Department of Education, published data, School Years 2006-2007 and 2008-2009, 2010-11.

Methodology: The number and percent of students eligible for the Free and Reduced-Price School Lunch (FRPL) Program in a school district or county. The denominator is the total number of eligible students in a district/county. County totals and percentages have been calculated by the author. The average number of school breakfasts served daily is calculated by dividing the total number of breakfasts served by 180, the minimum number of days a district is required to be open. Data not available by school district for SY2010-11

Special Note: Children not eligible for the School Breakfast Program may purchase breakfast. The School Breakfast numbers in this table should not be interpreted to represent the number of students eligible for the School Breakfast Program.

PREKINDERGARTEN EXPERIENCE

Source: Connecticut State Department of Education, published data, School Years 2006-2007 and 2008-2009, 2010-1011.

Methodology: The number of children enrolled in kindergarten with preschool experience in the previous year as a percent of the total kindergarten enrollment for a district or county on October 1st of the school year in question. Preschool experience is defined as regularly attending Head Start, nursery school, licensed day care center, or public preschool program during the previous school year or summer.

Special Note: Information is obtained through self-reports from parents to the school's administration, then totaled by the district. It is not clear that parents' definition of preschool experience is comparable to the

definition noted above. Some independent analysts believe these numbers could be either overestimated or underestimated, depending on the district.

CONNECTICUT MASTERY TEST (CMT) SCORES 4TH GRADERS

Source: Connecticut State Department of Education, published data, School Years 2007-2008 and 2010-2011.

Methodology: The number and percent of fourth graders who scored at or above the state goal on all three tests of the Connecticut Mastery Test (CMT) as a percentage of all fourth graders tested in a district. The CMT evaluates students on their reading, writing, and mathematics skills. The Department sets the expected level of achievement for all fourth grade students.

CONNECTICUT ACADEMIC PERFORMANCE TEST (CAPT) SCORES-10TH GRADERS

Source: Connecticut State Department of Education Reports/Profiles <http://sdeportal.ct.gov/Cedar/WEB/ResearchandReports/DataBulletins.aspx>, School Years 2009-2010, 2010-2011.

Methodology: The number and percent of tenth grade students who scored at or above the state goal on all four tests of the Connecticut Academic Performance Test (CAPT) as a percentage of all tenth grade students tested in a district. The CAPT evaluates students on their language arts, mathematics, and science skills and an inter-disciplinary task that involves writing and explanation. Summary numbers on their website are calculated using CAPT reporting rules. The summary numbers are not calculated using NCLB reporting rules. These calculation methods are different and often result in different calculations. Three reasons for discrepancies: 1. Students who moved after 10/1 are not included in calculations for Adequate Yearly Progress (AYP) but are in CAPT school or district performance calculations.

2. Skills Checklist students are counted in performance and participation calculations for AYP calculations but not in the CAPT school or district performance calculations. 3. Students with invalid scores on the CAPT are included in school and district AYP report calculations for performance and participation but not in the CAPT school or district calculations.

COHORT GRADUATION RATE

Source: Connecticut State Department of Education. CEDR website. <http://sdeportal.ct.gov/Cedar/WEB/ResearchandReports/DataBulletins.aspx>

Methodology: The Connecticut Department of Education (CSDE) introduced the four-year cohort graduation rate with the graduating class of 2009. This approach is used in Connecticut along with 49 other states to have a uniform system for tracking students. The four-year cohort graduation rate is calculated by tracking an individual cohort (or group of students) from their initial entrance into 9th grade through to graduation with a regular high school diploma in four years or less. The calculation uses individual student -level data from the state's Public School Information System (PSIS) that was submitted by school districts and certified by superintendents. Graduation rates will not be publicly reported for cohort counts fewer than 6. A district cohort graduation rate may not equal the average of schools' graduation rate or a school graduation rate because of outplaced students.

EDUCATION-RELATED DEFINITIONS

Regional School Districts serve students from surrounding towns. Some regional school districts serve students from kindergarten through grades six or eight, some serve six or eight through grade twelve, and some districts serve all students.

Connecticut Charter Schools include the following:

Achievement First Bridgeport Academy (Grades 5-8), Bridgeport; The Bridge Academy (Grades 7-12), Bridgeport; New Beginnings Family Academy (Grades K-8), Bridgeport; Park City Prep Charter School (Grades 6-8), Bridgeport; Highville Charter School, Inc. (Grades PK-8), Hamden; Achievement First Hartford Academy (Grades K-3 and 5-7), Hartford; Charter School for Young Children on Asylum Hill (Grades PK3-2), Hartford; Jumoke Academy (Grades PK-8), Hartford; Odyssey Community School (Grades 4-8), Manchester; Amistad Academy (Grades K-12), New Haven; Common Ground High School (Grades 9-12), New Haven; Elm City College Preparatory School (Grades K-11), New Haven; Interdistrict School for Arts and Communication (Grades 6-8), New London; Integrated Day Charter School (Grades PK-8), Norwich; Side by Side Community School (Grades PK-8), South Norwalk; Stamford Academy (Grades 9-12), Stamford; Trailblazers Academy (Grades 6-8), Stamford; and Explorations Charter School (Grades 10-12), Winsted.

Connecticut Magnet Schools include the following: Reggio Magnet School of the Arts (Grades PK3-2), Avon; Big Picture High School (Grades 9-11), Bloomfield; Metropolitan Learning Center for Global and International Studies (Grades 6-12), Bloomfield; Wintonbury Early Childhood Magnet School (Grades PK-K), Bloomfield; Six to Six Interdistrict Magnet School (Grades PK-8), Bridgeport; Western CT Academy of International Studies Elementary Magnet School (Grades K-5), Danbury; Quinebaug Valley Middle College High School (Grades 10-12), Danielson; CT International Baccalaureate Academy (Grades 9-12), East Hartford; East Hartford-Glastonbury Elementary Magnet School (Grades K-5), East Hartford; Two Rivers Magnet Middle School (Grades 6-8), East Hartford; CT River Academy at Goodwin College (Grades 9-10), East Hartford; International

Magnet School for Global Citizenship (Grades PK3-2), East Hartford; CREC Public Safety Academy (Grades 6-11), Enfield; Hyde Leadership Magnet (Grades 9-12), Hamden; Wintergreen Interdistrict Magnet (Grades K-8), Hamden; STEM Magnet School at Annie Fisher (Grades K-8), Hartford; Breakthrough Magnet (Grades PK3-8), Hartford; Capital Preparatory Magnet (Grades 6-12), Hartford; Classical Magnet (Grades 6-12), Hartford; Greater Hartford Academy of the Arts (Grades 9-12), Hartford; Greater Hartford Academy of Mathematics and Science (Grades 9-12), Hartford; Hartford Magnet Middle (Grades 6-8), Hartford; Mary M. Beecher Museum Magnet School of Arts and Sciences (Grades PK-8), New Haven; Mauro-Sheridan Science, Technology & Communications Interdistrict Magnet (Grades PK-8), New Haven; Ross-Woodward Magnet School of Classical Studies (Grades PK-8), New Haven; Science and Engineering University Magnet (Grades 6-12), New Haven; Dual Language Arts Academy/La Academia De Las Artes Bilingue (Grades 6-8), New London; Regional Multicultural Magnet (Grades K-5), New London; Science & Technology Magnet High School of Southeastern CT (Grades 9-12), New London; ACES Collaborative Alternative Magnet School for Leadership (Grades 7-12), Northford; Center for Global Studies at Brien McMahon High (Grades 9-12), Norwalk; Academy of Information Technology and Engineering (Grades 9-12), Stamford; Rogers International (Grades K-8), Stamford; Academy for the Performing Arts (a program of Cooperative Educational Services) (Grades 9-12), Trumbull; Regional Center for the Arts (a program of Cooperative Educational Services) (Grades 9-12), Trumbull; Maloney Interdistrict Magnet (Grades PK-5), Waterbury; Rotella Interdistrict Magnet (Grades PK-5), Waterbury; Waterbury Arts Magnet (Grades 6-12), Waterbury; The Friendship School (Grades PK-K), Waterford; University of Hartford Magnet (Grades PK3-5), West Hartford; ACT Performing Arts Magnet High (Grades 9-12), Willimantic; and Pathways to Technology (Grades 9-12), Windsor.

Regional Education Service Centers include: Area Cooperative Educational Services (ACES), North Haven; Capital Region Education Council (CREC), Hartford; Cooperative Educational Services (CES), Trumbull; EASTCONN, Hampton; Education Connection, Litchfield; and LEARN, Old Lyme.

Connecticut Technical High Schools include: Emmett O'Brien, Ansonia; Bullard-Havens, Bridgeport; Bristol Technical Education Center, Bristol; Henry Abbott, Danbury; H. H. Ellis, Danielson; Eli Whitney, Hamden; A.I. Prince, Hartford; Ella T. Grasso Southeastern, Groton; Howell Cheney, Manchester; H. C. Wilcox, Meriden; Platt, Milford; Vinal, Middletown; E. C. Goodwin, New Britain; Norwich, Norwich; J. M. Wright, Stamford; Stratford School for Aviation Maintenance Technicians, Stratford; Oliver Wolcott, Torrington; W. F. Kaynor, Waterbury; Windham, Willimantic.

Unified School District #1 consists of 20 schools serving incarcerated individuals in grades 3 through 12. This district is run by the Connecticut Department of Corrections.

Unified School District #2 runs two schools for children who reside in facilities run by the Connecticut Department of Children and Families.

Other includes endowed and incorporated academies—Gilbert School for students in Winchester, Norwich Free Academy for students in Norwich, and Woodstock Academy for students in Woodstock.

LATE OR NO PRENATAL CARE

Source: Connecticut Department of Public Health, published data SFY 2007, 2009 http://www.ct.gov/dph/cwp/view.asp?a=3132&q=394598&dphNav_GID=1601&dphNavPage=|46941 Registration Reports Table 4.

Methodology: The number of births for which mothers received late or no prenatal care as a percentage of all live births in a town or county. Late or no prenatal care is defined as that which takes place after the first trimester of pregnancy. Percentages are calculated using the total number of births for which the status of prenatal care is known as the denominator. Percentages for towns in

which fewer than five pregnant women received late or no prenatal care are not calculated because of the unreliability of calculations based on small numbers.

LOW BIRTH WEIGHT

Source: Connecticut Department of Public Health, published data http://www.ct.gov/dph/cwp/view.asp?a=3132&q=394598&dphNav_GID=1601&dphNavPage=|46941 Registration Reports Table 4. SFY 2007,2009.

Methodology: The number of low birth weight infants as a percentage of all live births. Low birth weight is defined as less than 2,500 grams (5 pounds, 8 ounces). Percentages are determined using the number of births for which the birth weight is known as the denominator.

INFANT MORTALITY

Source: : Connecticut Department of Public Health, published data http://www.ct.gov/dph/cwp/view.asp?a=3132&q=394598&dphNav_GID=1601&dphNavPage=|46941 Registration Reports Table 2B. SFY 2002-04 2004-06, 2007-09

Methodology: The annual average rate of infant deaths (children under one year of age) per 1,000 live births. The infant mortality rate is calculated by summing the number of infant deaths over three years and dividing by the number of live births for that time period, then multiplying by 1,000. Rates for towns in which fewer than five infants died are not calculated because of the unreliability of calculations based on small numbers.

HUSKY A AND B – CHILD ENROLLMENT

Source: Connecticut Department of Social Services, published data, January 1, 2008, and January 1, 2010, January 1, 2012 reported by Connecticut Voices for Children. Retrieved from http://www.ctkidslink.org/media/other/covhusky_kids.xls

Methodology: The number of children under age 19 enrolled in HUSKY A (Medicaid managed care) and HUSKY B (Connecticut's State Child Health Insurance Program – SCHIP) by town or county.

CHILD DEATHS

Source: Connecticut Department of Public Health, unpublished data, SFYs 2000-2009; U.S. Census, 2000 Census, Summary File 1, Table P12 – Sex by Age, Total Population.

Methodology: The total number of child deaths for a five-year period by town or county. Rates per 100,000 children are calculated as the number of deaths from all causes of children between one and 14 years of age for the reporting period divided by the total number of children in that age group, then multiplied by 100,000. The total number of children ages one to 14 is estimated by applying the 1990 or 2000 Census proportions to the population estimates from the Connecticut Department of Public Health for that year. Rates for towns in which fewer than 5 children died are not calculated because of the unreliability of calculations based on small numbers.

TEEN BIRTHS

Source: Connecticut Department of Public Health, published data http://www.ct.gov/dph/cwp/view.asp?a=3132&q=394598&dphNav_GID=1601&dphNavPage=|46941, Registration Reports Table 4, Table 1 SFYs 2007 and 2009; U.S. Census Bureau, 2000 Census, Summary File 1, Table P12 – Sex by Age, Total Population.

Methodology: The number of births to girls age 15-17 per 1,000 females for that age group in a town or county. The rate is calculated by dividing the number females 15-17 years old who gave birth by the total number of all females in that age group in a town or county and multiplying by 1,000. The total number of girls 15 to

17 years old is estimated by applying the 2000 Census proportions to the population estimates from the Connecticut Department of Public Health for those years.

Special Note: This indicator is different than the total number of babies born to women under 18 as a percentage of all live births.

The birth rate of 18 and 19 year-old girls is not reported because the number of females in this age group is skewed in towns with colleges. Similarly, births to girls under age 15 have been excluded because there are very few for this group (about 60 per year). The inclusion of females under 15 in the denominator would dramatically lower the rate, giving an underestimate of the risk for teen births to teenagers.

SUBSTANTIATED ABUSE AND/OR NEGLECT

Source: Connecticut Department of Children and Families, published data, SFYs 2005 and 2010; Connecticut Department of Public Health, Estimated Populations in Connecticut as of July 1, 2005; 2010 U.S. Census, 2000 Decennial Census, Summary File 1, Table P12 – Sex by Age, Total Population.

Methodology: The unduplicated number of children under age 18 who were the victims of substantiated abuse and neglect or were uncared for during the stated year. The rate is calculated as the total number of substantiated cases divided by the total number of children under age 18, and multiplied by 1,000. The total number of children under age 18 is estimated by applying the 2000 Census proportions to the population estimates from the Connecticut Department of Public Health for those years. Note: According to the Connecticut Department of Children and Families, in both years, a significant number of

cases did not correspond with any official Connecticut town name. This anomaly is the result of incorrect data entry or other technical factors.

PREVENTABLE TEEN DEATHS

Source: Connecticut Department of Public Health, unpublished data, SFYs 2004-2009; U.S. Census, 2000 Census, Summary File 1, Table P12 – Sex by Age, Total Population.

Methodology: The total number of preventable deaths to teens age 15 to 19 for a five-year period by town or county. Preventable deaths are defined as deaths from accidents, suicides, and homicides. Rates per 100,000 teens are calculated as the number of preventable deaths of teens age 15 to 19, divided by the total number of teens in this age group, multiplied by 100,000. The total number of teens age 15 to 19 is estimated by applying the 2000 Census proportions to the population estimates from the Connecticut Department of Public Health for those years. Rates for towns in which fewer than five teens died are not calculated because of the unreliability of calculations based on small numbers.
