Acknowledgements

This report was prepared by the Center for Urban Community Services Housing Resource Center (CUCS) and the University of Pennsylvania Center for Mental Health Policy and Services Research (UPenn CMHPSR) on behalf of the following sponsors of *CT Counts 2007*: the Reaching Home Campaign (an initiative of the Partnership for Strong Communities), the Connecticut Coalition to End Homelessness and the Corporation for Supportive Housing.

The authors and count sponsors are deeply grateful to the State of Connecticut Office of Policy and Management, Department of Mental Health and Addiction Services, Office for Workforce Competitiveness, Department of Social Services and the Connecticut Housing Finance Authority, and to the Melville Charitable Trust, the Hartford Foundation for Public Giving, and the Community Foundation of Greater New Haven for providing funding for this project. We would also like to thank the count coordinators from each of the thirteen participating Continuums of Care, the staff of the participating non-profit agencies, and the volunteers whose commitment of time and willingness to canvass the streets of Connecticut on a bitterly cold night made the count possible.

I. Executive Summary

On January 30, 2007 communities across Connecticut conducted their first statewide count of homeless individuals and families. *CT Counts 2007* was an historic effort that brought together non-profits, local and state government agencies, and hundreds of concerned citizens from every region of the state to gather critical data. The data will be used to inform efforts to end homelessness in Connecticut and to help service providers and policy makers to better understand the needs of homeless people.

Collecting reliable baseline data is essential to understanding the causes of homelessness and designing effective interventions to help homeless people rebuild their lives. *CT Counts 2007* is a first step in ongoing efforts to collect data at regular intervals utilizing a consistent and rigorous methodology. With logistical, technical, and training support from Connecticut's thirteen Continuums of Care, the Reaching Home Campaign (an initiative of the Partnership for Strong Communities), the Connecticut Coalition to End Homelessness, the Corporation for Supportive Housing, the Center for Urban Community Services Housing Resource Center (CUCS) and the University of Pennsylvania Center for Mental Health Policy and Services Research (UPenn CMHPSR), *CT Counts 2007* mobilized hundreds of agencies and individuals to gather data about the number and needs of the people who experienced homelessness on a single night. The following is a summary of some of the key findings from the effort:

- An estimated 3,325 households experienced homelessness on the night of January 30, 2007. Of those, 2,138 single adults and 392 families with minor children resided in emergency shelter or transitional housing programs and 707 single adults and 38 families resided on the streets, in parks, cars, transportation terminals, or other locations not intended for human habitation.
- 797 homeless children were counted along with their families: 69 in unsheltered locations and 728 in emergency shelters and transitional housing programs.
- Fifteen unaccompanied youth were counted in unsheltered locations and 35 were counted in sheltered locations.
- Among sheltered single adults, males represented 72% of those counted with females representing 26%. By contrast, among sheltered adults in families, females represented 83%.
- Among the unsheltered, men comprised 80% of single adults and women 74% of adults in families.
- While the majority of adults in sheltered families (67%) were between the ages of 22 and 39, the majority of sheltered single adults were older with 57% being between the ages of 40 and 59.
- With the exception of sheltered adults in families, all groups most frequently reported their racial/ethnic identity as white.

- Long periods of homelessness were commonly reported among all groups, though families reported shorter periods than single adults. An estimated 961 chronically homeless adults were found in sheltered and unsheltered locations across the state. About half of single adults reported one or more years since last having a permanent residence.
- The most commonly specified reason across all categories for leaving one's last place of residence was rent problems.
- Reported levels of educational attainment were higher among sheltered than unsheltered people. Fifty-five percent of sheltered adults (both singles and families) completed at least high school.
- The most commonly reported source of income across all groups was Food Stamps. Sheltered single adults reported significantly higher rates of Social Security Income than either unsheltered single adults or families; sheltered families reported significantly higher rates of TANF income than unsheltered families.
- Twenty-nine percent of sheltered adults in families, 26% of unsheltered adults in families, 19% percent of sheltered single adults, and 12% of unsheltered single adults reported that they are currently working.
- Histories of behavioral health issues were common among both sheltered and unsheltered single adults and were significantly less common among adults in families.
- Reports of health conditions that limit ones ability to work, get around, or otherwise take care of ones needs were also significantly more common among single adults than adults in families.

II. Introduction

On January 30, 2007 communities across Connecticut conducted a statewide count of homeless individuals and families living in emergency shelters, in transitional housing programs, in the woods, on the streets, and in cars or other unsheltered locations. *CT Counts 2007* was the first coordinated, statewide enumeration of homeless people in the State of Connecticut using consistent data collection methods. This historic effort brought together non-profits, local and state government agencies, and hundreds of concerned citizens from every region of the state to gather critical data that will be used to inform efforts to end homelessness in Connecticut and by communities across the state in their applications for federal homeless assistance funding.

In 2001 the Reaching Home Campaign estimated that approximately 33,000 individuals, including 13,000 children, experience homelessness in Connecticut every year. *CT Counts 2007* provides information about the number and needs of people who are homeless at a specific point in time. The data collected will help service providers and policy makers to better understand the dimensions of homelessness and help to establish, over time, a means to measure the effectiveness of initiatives to end homelessness.

Since 2003, the U.S. Department of Housing and Urban Development (HUD) has required applicants for federal homeless assistance grants to report the number of people who are homeless in their communities at a particular time. HUD currently requires that communities conduct a point-in-time count during the last week of January. Collecting reliable baseline data is essential to understanding the causes of homelessness and designing effective interventions to help homeless people rebuild their lives. The organizers of *CT Counts 2007* recognize that this report is merely a first step and that continued data collection at regular intervals will be necessary to understand the dynamic causes of homelessness, to evaluate the effectiveness of programs serving homeless people and, ultimately, to track progress towards ending homelessness in Connecticut.

Throughout this report "single adult" refers to a person 18 years of age or older who is not accompanied by minor children, "unaccompanied youth" refers to a person under 18 years of age who is not accompanied by a parent or guardian, and "family" refers to a household of two or more people that includes minor children. This report uses the HUD definition of homelessness which includes only people who fit one of the following descriptions at the time of the count: an unsheltered homeless person resided in a place not meant for human habitation, such as cars, parks, sidewalks, abandoned buildings, or on the street; a sheltered homeless person resided in an emergency shelter or transitional housing for homeless persons who originally came from the streets or emergency shelters.

III. Data Collection Methodology

In October 2006, the Reaching Home Campaign (an initiative of the Partnership for Strong Communities), the Connecticut Coalition to End Homelessness and the Corporation for Supportive Housing, reached out to CUCS and UPenn CMHPSR for assistance in organizing a statewide count of homeless people. With just a few months to mobilize non-profit service providers, state and local government agencies and volunteers from every region of the state, the count organizers drew heavily from the experience, expertise, and networks already developed by the local Continuums of Care¹ that had conducted similar counts in the past.

The organizers knew that fully canvassing the more than 5,000 square miles within the State of Connecticut was not feasible and that they would need to rely on the extensive knowledge of the state's non-profit and public sector homeless services agencies to determine in which areas homeless people would most likely be found. Utilizing a collaborative process that included several meetings with service providers and

_

¹ HUD requires applicants for federal homeless assistance grants to develop a community plan to organize and deliver housing and services to meet the specific needs of people who are homeless in their communities. The plans are typically developed by a collaborative of non-profit and government agencies, private foundations, concerned citizens, and homeless people. Those collaboratives are known as "Continuums of Care."

government officials from localities across the State, the organizers developed a standardized count methodology and volunteer recruitment strategy. Together, stakeholders developed a survey that was administered to homeless people on the night of the count and a process for determining which areas volunteers would canvass.

The Cartographic Modeling Lab (CML) at the University of Pennsylvania developed detailed maps of every area. In total, the CML mapped 2617 block groups across the state of Connecticut. In order to determine the probability that unsheltered homeless people would be found in each area, the State's thirteen distinct Continuums of Care then consulted with key informants, including outreach teams, soup kitchens, homeless people, service providers, police/sheriff departments, and local government agencies. Using that information, Continuums assigned a "probability rating" to each block group based on the probability of finding people living in locations not meant for human habitation on the night of the count. A Low rating signified a probability of finding fewer than 2 people in unsheltered conditions; a High rating signified probability of finding 2 or more people in unsheltered conditions; and a Certain rating was applied to sites that Continuums determined were "certain" to have 2 or more homeless persons in unsheltered locations. Block groups for which the Continuums were unable to determine the density rating were designated Null (Table 1).

Table 1. Stratification of Block Groups by Density Rating

Continuum of Care	Total	Certain	High	Low	Null
Balance of State	1118	79	93	547	399
Bridgeport/Stratford	200	15	139	46	
Bristol	41		6	35

Stamford/Greenwich	136	8	3	125	
Waterbury	82		3	79	
TOTALS	2617	333	340	1468	476

To ensure rigorous fidelity to the sampling methodology, researchers at UPenn selected which areas would be canvassed. In choosing the block groups to be canvassed, the CML used a web-based randomization calculator (random.org) to assign the block groups to be included in the sample.

With the exception of two large geographic regions that make up the Balance of State² and the New London Continuums of Care, teams were instructed to fully canvass selected block groups for every area rated as Certain. Teams also were instructed to fully canvass High probability areas in Continuums with fewer than 30 block groups. Among continuums with 70 or more Certain block groups and 30 or more High probability block groups, Continuums were instructed to canvass 20% of the respective areas (Table 2).

² The Balance of State Continuum of Care develops strategies to coordinate homeless assistance in areas not covered by other Continuums. It includes East Hartford, Hamden Town, Hartford County (excluding the City of Hartford), Litchfield County, Manchester, Meriden, Milford Town, New Haven County (excluding the City of New Haven), Tolland County, West Hartford, West Haven, and Windham County.

TOTALS	333	340	1867

^{*} Counts in this column include block groups designated as Low density and exclude those designated as Null.

In total, 17%, or 446, of the total 2,617 block groups, were to be canvassed (Table 3). Draft maps detailing each of the randomly chosen block groups were provided for review to the Continuums of Care. Finalized copies of each of the maps were provided to the enumerators in advance of the night of the count (See Appendix O for a map depicting the areas covered by each Continuum of Care and a sample map similar to those used by enumerators on the night of the count).

Null block groups were added to the Low density counts before sampling 10% of the block groups in Low density areas where the number of block groups was less than 100; 5% among areas where the number of block groups was between 100 and 299; and 3% among areas with 300 or more block groups (Table 3).

^{*} Counts in this column include block groups designated as low density and those designated as null.

In order to minimize the chances of duplication (i.e. counting individuals more than once) and to maximize volunteer participation, stakeholders decided collectively to conduct the count during a two hour window from 7 p.m. to 9 p.m. on January 30, 2007. Also, to avoid duplication, teams were assigned to cover unique study areas,

volunteers were identified by large buttons and interviewers asked each person whether they had already been interviewed.

Count organizers trained representatives from each Continuum of Care, who were in turn responsible for training volunteers. Organizers instructed trainees to count each unsheltered homeless person they encountered indicating basic demographic information about gender, age, and household type. Volunteers were advised to enter public places where homeless people may seek comfort, such as train and bus stations, airports, laundromats, and libraries.

Trainers urged volunteers not to rely on judgments about what homeless people look like and to approach as many people as practicable to conduct an interview and determine who is homeless. In circumstances in which many people were present and approaching everyone was not practicable, trainers offered guidance on detecting signs that a person might be homeless.

In addition, count organizers instructed trainees not to trespass on private property, and volunteers were urged to use their judgment and not canvass areas that they believed to be unsafe. For example, volunteers may not have canvassed areas including abandoned buildings, remote wooded areas, alleys, areas under overpasses/bridges and areas along train tracks.

Teams also administered an anonymous survey to the unsheltered homeless adults and unaccompanied youth they encountered. The count organizers designed the survey instruments through a collaborative process drawing on the expertise of researchers from the University of Pennsylvania, statewide organizations, and local service providers. Surveys collected more detailed information about demographics, prior living arrangements, length and causation of homelessness, income, disability, health, and parental status. The survey instruments used for unsheltered and sheltered populations are included in Appendices P and Q of this report.

Except in New Haven, where a large sample size was predicted based on past counts and teams conducted interviews with every second person, all regions attempted to interview every homeless adult and unaccompanied youth encountered. Volunteers in New Haven used a tally sheet to capture via observation basic demographic data about individuals that were not interviewed. The tally sheet is included in Appendix R of this report. Other regions used the survey form to record basic visible demographic data for people they were unable to interview.

Volunteers were instructed not to wake sleeping individuals and not to attempt to survey anyone who was agitated nor anyone whom they otherwise believed to be unsafe to approach. Volunteers were further advised to read each survey question exactly as written, not to interpret questions, and to re-read or skip questions as needed. If at any point the person being interviewed expressed a wish not to continue,

volunteers were instructed to terminate the interview. Where available, volunteers were also provided with instructions on accessing shelter services for unsheltered homeless people.

Each emergency shelter and transitional housing program serving homeless people in the state of Connecticut also counted the number of adults, families and children staying in their programs on the night of January 30th. Programs recorded that data on forms provided by count organizers. Count forms for sheltered people are included in Appendix S of this report. Programs serving thirty or fewer adults on the night of the count interviewed each adult using a survey instrument that was virtually identical to the one used in the unsheltered count. Programs serving 31 or more adults interviewed 33% of adults, and programs that were not required to interview every adult used a methodology devised by researchers from UPenn to select a random sample.

IV. Data Analysis

CUCS entered all data from sheltered and unsheltered client surveys, unsheltered tally sheets, and sheltered people count forms into a database. Only data for people meeting the HUD definition of homelessness³ were analyzed (see page 13 for a discussion of the definition of homelessness used). Illegible and inconsistent client survey data were discarded. Where surveys reported a respondent age of under 18 years, though their year of birth indicated to the contrary, CUCS used year of birth to determine client age. CUCS and/or Continuum of Care leaders contacted programs as needed to attempt to obtain usable data for sheltered client population counts. In circumstances in which sheltered client survey data could be used to approximate missing sheltered population counts, CUCS used those data.

The data were analyzed and are presented in this report both on a statewide basis and grouped by the following thirteen Continuums of Care, each covering distinct regions of the state: Balance of State, Bridgeport/Stratford/Fairfield, Bristol, Greater Danbury, Hartford, Litchfield, Middletown/Middlesex County, New Britain, New Haven, Norwalk-Fairfield County, Norwich/New London City, Stamford/Greenwich, and Waterbury⁴. The data contained in Appendices A-N were obtained from surveys conducted with sheltered and unsheltered adults and unaccompanied youth. CUCS used available survey data for each Continuum of Care to estimate the number of people reported in each data element. For each Continuum, we calculated the prevalence of each survey response then applied that rate to the total number of people.

-

³ The HUD definition of homelessness includes only people who reside in one of theses places at the time of the count: an unsheltered homeless person resides in a place not meant for human habitation, such as cars, parks, sidewalks, abandoned buildings, or on the street, and a sheltered homeless person resides in an emergency shelter or transitional housing for homeless persons who originally came from the streets or emergency shelters.

⁴ A map of the areas covered by each Continuum of Care is included in Appendix O.

In addition, to provide estimates of the number of unsheltered people among the non-sampled block groups (i.e. block groups that were designated as Certain, High, or Low but were not among those randomly selected to be canvassed), UPenn employed a basic imputation strategy. For each non-sampled block group, UPenn used the mean count of homeless found in the Low density canvassed area in the Continuum of Care in which the block group is found as the imputed value. We then multiplied that average by the number of non-sampled block groups. ⁵

Our first attempt to impute the number of unsheltered people among the non-sampled block groups yielded artificially high counts in Balance of State and Waterbury. We determined that this was due to the fact that a large number of the non-sampled block groups—particularly those across the geographic sprawl of the Balance of State—were likely in areas that had no or extremely low population counts. A review of census data revealed this to be the case. In the final analysis, these non-sampled block groups were reclassified from Low density to Extremely Low density and excluded from the imputation (Table 4).

_

⁵ Two factors guided our decision to use the average from the Low density areas to impute the values for the non-sampled block groups: *A priori*, the Continuums of Care had identified and sampled all known Certain/High block groups, so it was unlikely that *additional* Certain/High block groups would be found among the non-sampled block groups. Moreover, *post hoc*, the Continuums of Care generally did not interview as many people across the Certain/High canvassed block groups as had been anticipated. We therefore reasoned that the Low density canvassed block groups provided the best information that we could use impute the number of people we would expect to find among the non-sampled block groups.

Table 4. Imputation of Unsheltered Homeless Counts among Non-Sampled Block Groups

			-Sampled ck Groups

TOTALS	2617	2046	339	206	748

^{*} Includes both Sampled (i.e. areas designated for canvassing) and Non-Sampled block groups.

V. Limitations and Caveats

The authors recognize the challenges inherent in any attempt to count homeless people, including but not limited to controversy surrounding the definition of homelessness; the difficulty of determining who meets the chosen definition; the logistical challenges of canvassing a large area in a short period of time; the possibility of duplication (i.e. counting people more than once); and the difficulty of finding homeless people who may be well-hidden, particularly in bad weather.

Consistent with HUD guidelines, *CT Counts 2007* attempted only to enumerate those individuals and families who are literally homeless, that is those who are living in emergency shelters or transitional housing programs for homeless people and those who are sleeping in places not meant for human habitation such as streets, parks, and other public places. The effort did not attempt to count those who are precariously housed, such as people who are living temporarily with friends or family, those in overcrowded or substandard housing, or those who are paying extremely high proportions of their resources towards rent. *CT Counts 2007* also did not count residents of transitional housing programs that are not specifically designated for homeless people. For example, residents of mental health, substance abuse, and child welfare programs were only counted if the program specifically serves homeless people.

[#] Extremely Low density block groups are not included in the imputations for non-sampled block groups.

CT Counts 2007 did not attempt to conduct a complete coverage count and instead used a statistically reliable sampling methodology to arrive at a statewide estimate of the number of sheltered and unsheltered homeless people in the State of Connecticut on January 30, 2007. In addition, the authors acknowledge that limited time and resources available to plan the count may have impacted the results and that CT Counts 2007 did not use quality assurance mechanisms to assess the accuracy of the count or to determine the proportion of un-surveyed people.

The authors also recognize the inherent difficulties of counting certain subpopulations of unsheltered homeless people including youth, undocumented immigrants, and families with minor children, and the likelihood that the data contained in this report represent an undercount of those groups. Homeless minor youths are likely not to be readily visible to volunteer enumerators because they commonly desire to remain undetected by child welfare and criminal justice authorities and are susceptible to violence on the streets. Similarly, given fears regarding child welfare system involvement, unsheltered homeless families with minor children are also often not readily visible. Because undocumented immigrants are frequently fearful of interaction with immigration and criminal justice authorities, they too can be difficult to detect. In addition, the authors note that survey response rates were lower for unsheltered than sheltered households.

Furthermore, Continuums of Care had a short window of time to assign density ratings to each mapped area, thereby limiting their ability to observe the areas at different hours and over a period of time. A longer period of observation would help Continuums of Care to detect dynamic patterns of mobility among unsheltered homeless people and to test preliminary density ratings. Because the extrapolation of the total count relies on the quality of the identification of the block group density ratings, inaccuracies in the ratings could have had a significant impact on overall count results.

The results listed in Table 5 suggest substantive differences between the actual and expected block group density distributions. For example, among the nine Continuums of Care that initially identified 10 or more block groups as Certain to have 2 or more homeless people, only two Continuums found people within at least half the block groups (Table 5). Similarly, the number of homeless people observed among Continuums that identified 10 or more High density block groups was 63% lower than expected by the sample design (Table 5). Whatever the reasons that may have contributed to the gap between the actual and expected block group distributions – including refusals, no one present in the areas, language problems, or the limited window of time for canvassing the areas, since the Continuums expected to conduct the majority of the interviews among people within the Certain and High density block groups, the resulting counts in these areas are a factor that has important implications for the quantity of the data collected.

Also, as a result of limited time, survey instruments and sheltered count forms were not field tested, and a flaw in the survey instrument design resulted in a failure to capture data on the number of unsheltered households with accompanying dependent children (While published reports suggest that, statistically, the likelihood of finding unsheltered families is low, obtaining more precise information about the size, distribution, and composition of unsheltered families is an important study goal.) CUCS compensated for this flaw by utilizing data about number, gender, and ages of children accompanying each adult to determine which adults were members of the same household.

The limited window of time available for planning also prevented study areas from being consistently pre-screened; pre-screening would allow for better understanding of hidden areas that enumerators might miss, as well as clarification of confusing area boundaries, and assessment of the difference between use patterns at night and during the day. The time allotted also did not permit pre-testing i.e. a dry-run count in a sample of study areas that would help organizers to identify and resolve logistical and procedural issues.

Limited time also prohibited translation of the survey instrument into Spanish and dictated use of a "train the trainer" model, i.e. CUCS trained local leaders designated by each Continuum of Care who in turn trained volunteers. Furthermore, *CT Counts 2007* relied heavily on volunteers to consistently complete challenging tasks such as canvassing large areas on a very cold night, traveling to remote areas, approaching strangers, and attempting to interview every person encountered in areas that are heavily trafficked. The organizers also prioritized volunteer safety, and at least one region reported not counting people known to be living in abandoned buildings as a result of safety instructions given to volunteers. In addition, in circumstances in which interviews of each person encountered were not practicable, or, in the case of New Haven, were not called for by the methodology, the count relied on volunteers' own determinations about who is homeless.

When selecting the time of the count, organizers juggled several competing needs, such as volunteer recruitment and safety, sufficient time to cover all study areas, and minimization of duplication. The City of New Haven reported that they were unable to thoroughly canvass each study area during the short two hour window. In addition, the Danbury, Hartford, Litchfield, and Waterbury Continuums of Care decided that the selected time was inconsistent with local needs and conducted their count at an alternative time resulting in a greater possibility of duplication (e.g. a person could be counted by one Continuum on the street during the day and again by another Continuum in a shelter at night). To protect against duplication, enumerators asked all sheltered and unsheltered survey participants if they had already been interviewed by someone wearing a *CT Counts 2007* button, and anyone who responded affirmatively was removed from the set.

Additional limitations relate to the taxing role of the program staff. The count of sheltered homeless people relied heavily on program staff to accurately complete forms in accordance with instructions. Though organizers provided detailed instructions in writing and via trainings, staff whose primary responsibility is to the well-being of clients and the efficiency of program operations, likely faced competing demands on their time. These demands may have interfered with their ability to provide accurate and comprehensive data. Furthermore, trainings were held at a single, centralized location, thereby requiring significant travel. Many programs, in fact, did not send staff to training and there are at least seven emergency shelter and transitional housing programs that submitted neither people count nor sheltered client survey data. The authors acknowledge that failure of programs to participate in the count and a pattern of errors in completing count forms likely resulted in an undercount of sheltered homeless people.

Given the limitations described above and significant differences among the CT Counts 2007 methodology and count methodologies used by various communities in the past, the authors caution against comparisons of the results contained in this report and the results of previous counts of homeless people in Connecticut, as well as against comparisons between these results and national statistics on homelessness. The authors view CT Counts 2007 as an important step towards developing a consistent and reliable methodology for a statewide count and establishing a baseline by which initiatives to end homelessness can be measured; however, the authors view the results as preliminary and caution against drawing conclusions that cannot be supported by the data, especially given the caveats and limitations described here. Furthermore, the authors recognize that continued data collection at regular intervals will be necessary to understand the dynamic causes of homelessness, to evaluate the effectiveness of programs serving homeless people and, ultimately, to track progress towards ending homelessness in Connecticut. Fortunately, the state is involved in a statewide implementation of a Homeless Services Management Information System, or HMIS, which will be an important source of information on these aspects of homelessness and service provision in the future.

VI. Results

The estimates derived from *CT Counts 2007* indicate that a total of 3,325 households experienced homelessness on the night of January 30, 2007. Of those, 2,138 single adults and 392 families with minor children resided in emergency shelters or transitional housing programs, and 707 single adults and 38 families with minor children resided on the streets, in parks, cars, transportation terminals, or other locations not intended for human habitation. Seven hundred and ninety-seven (797) homeless children were counted along with their families: 69 in unsheltered locations and 728 in emergency shelters and transitional housing programs.

Fifteen unaccompanied youth were counted in unsheltered locations, and 35 were counted in sheltered locations. Table 6 shows the total number of sheltered and unsheltered families and single adults throughout the State and in each Continuum of Care. The tables contained in Appendices A through N show data gathered through surveys of sheltered and unsheltered homeless people, including demographic data; data describing housing and homeless history, education, employment, and benefits history data; and data describing special needs among surveyed homeless individuals.

The largest number of sheltered homeless households were counted at programs located within the New Haven (n=521) and Hartford (n=507) Continuums of Care. Together the households residing in these two regions represented 40% percent of the total number of sheltered homeless households counted. These two regions sheltered both the greatest number of single adults (Hartford n=433, New Haven n=442) and the greatest number of families (Hartford n=65, New Haven n=66) (Table 6). A total of fifteen unsheltered unaccompanied minor youth were counted in the regions represented by the Bridgeport/Stratford/Fairfield, Litchfield County, Middletown/Middlesex County, New Haven, Norwalk/Fairfield County, and Waterbury Continuums of Care. An additional 35 unaccompanied youth were counted in sheltered locations in the Bridgeport/Stratford/Fairfield, Greater Danbury, Hartford, and New Haven Continuums (Table 6).

By comparison, unsheltered households were more evenly distributed throughout the state with four Continuums accounting for 55% of households (New Haven n=137, Waterbury n=102, Middletown-Middlesex n=94, and Balance of State n=89). The greatest number of unsheltered homeless families were counted in Middletown-Middlesex (n=12) and New Britain (n=10) and these two regions collectively represented 58% of total families counted (Table 6).

⁶ For a discussion of the particular challenges of counting unsheltered homeless youth see page 14.

The survey also sought data regarding the location of respondents' last place of permanent residence. Among sheltered single adults, the most commonly reported towns were Hartford (12%, n=247), New Haven (11%, n=241), and Stamford (10%, n=207). Among sheltered adults in families, the most commonly reported towns were Hartford (16%, n=70), New Haven (14%, n=60) and Bridgeport (12%, n=54). About 1% of households reported an out-of-state location. (Appendix A, Table A2).

Among sheltered single adults, males represented 72% of those counted (n=1532) and females 26% (n=552). By contrast among sheltered adults in families, females represented 83% (n=368). Among the unsheltered, men comprised 80% of single adults (n=565) and women 74% (n=28) of adults in families (Appendix A, Table A1).

While more than two-thirds of adults in sheltered families (67%) were between the ages of 22 and 39 (n=300), the majority of sheltered single adults were older with 57% being between the ages of 40 and 59 (n=1,204). All groups most frequently reported their racial/ethnic identity as white, with the exception of sheltered adults in families among whom 39% identified as Black or African American (n=176) and 37% identified as White (n= 165). Fifty-two percent of sheltered single adults (n=1106), 49% of unsheltered single adults (n=344), and 39% of unsheltered adults in families (n=15) reported white as their racial identity (Appendix A, Table A1).

The vast majority of sheltered households (79%, n=1,667 of single adults and 89%, n=393 of adults in families) reported that they had also resided at either an emergency shelter or transitional housing program the previous night. Among those who were unsheltered on the night of the count, 12% of single adults (n=87) and 10% of adults in families (n=4) reported residing at a shelter or transitional housing program the previous night. Shelters and transitional housing programs were also the most commonly reported locations where both sheltered single adults and adults in families stayed during the thirty days prior to the count. The unsheltered most frequently reported non-housing locations, such as streets, parks, cars, bus stations, parking garages, campgrounds, woods, and abandoned buildings, and living with family and friends as the places they had resided during the thirty days prior to the count (Appendix A, Table A2).

Long periods of homelessness were commonly reported among all groups, though families reported shorter periods than single adults. Among single adults, about half of sheltered respondents (46%, n=971) and of unsheltered respondents (51%, n=361) reported 1 or more years since last having a permanent residence. Among sheltered adults in families the majority reported less than one year since they last had a permanent residence (56%, n=245). The most commonly specified reason across all categories for leaving one's last place of residence was rent problems (Appendix A, Table A2).

Reported levels of educational attainment were higher among sheltered than unsheltered people. Fifty-five percent of sheltered adults (both singles and families) completed at least high school (n=1433) compared to 41% of unsheltered singles

(n=292), and 34% of unsheltered adults in families (n=13). About 15% of sheltered and unsheltered single adults reported that they had served in the military (n=410) (Appendix A, Table A3).

Though receipt of Food Stamps was the most commonly reported income source across all groups, a significantly lower proportion of unsheltered households reported accessing this benefit – 44% of sheltered single adults (n=934) compared to 28% of unsheltered single adults (n=201), and 77% of sheltered adults in families (n=342) compared to 26% of unsheltered adults in families (n=10) 7 . Sheltered single adults reported significantly higher rates of Social Security Income (22%, n=467) than either unsheltered single adults (12%, n=83) or families (sheltered families: 9%, n=4; unsheltered families: 13%, n=5) (Appendix A, Table A3).

Receipt of TANF (welfare) benefits was most common among adults in sheltered families (32%, n=141), while only 5% (n=2) of adults in unsheltered families received the same benefits. Twenty-nine percent of sheltered adults in families (n=128), 26% of unsheltered adults in families (n=10), 19% percent of sheltered single adults (n=409), and 12% of unsheltered single adults (n=87) reported that they are currently working (Appendix A, Table A3).

Histories of behavioral health issues were common among both sheltered and unsheltered single adults and were significantly less common among adults in families. Fifty-three percent of sheltered (n=1,124) and 54% of unsheltered (n=382) single adults reported that they had been in a hospital, detox, or rehabilitation program for a substance issue and 40% of sheltered (n=841) and 26% of unsheltered (n=184) single adults reporting a psychiatric hospitalization. By comparison, less than 20% of sheltered and unsheltered adults in families reported a mental health hospitalization (n=93). Twenty-four percent of sheltered (n=106) and 36% of unsheltered (n=14) adults in families reported that they had been in a hospital, detox, or rehabilitation program for a substance issue. Respondents commonly testified to health conditions that limit their ability to work, get around, or otherwise take care of their needs. Forty-five percent of unsheltered single adults (n=319), 40% of sheltered single adults (n=839), 27% of unsheltered adults in families (n=10), and 20% of sheltered adults in families (n=89) reported a limiting health condition (Appendix A, Table 10).

Despite common reports of psychiatric hospitalizations, use of inpatient substance abuse treatment and limiting health conditions, survey respondents tended to assess their overall health positively, though unsheltered respondents tended to report lower health ratings. On a scale of one to six with one being the worst and six being the best health rating, 68% of sheltered adults in families (n=265), 58% of sheltered single adults (n=1253), and 41% of unsheltered single adults (n=291) rated their health at

-

⁷ The authors note that 39% of surveyed unsheltered families did not provide a response to this question.

four or better. Reports of the worst health rating were most common among unsheltered single adults $(5\%, n=38)^8$ (Appendix A, Table A4).

Reports of histories of domestic violence were also common, though relatively few respondents cited domestic violence as the reason they left their last permanent place of residence. Less than 5% of sheltered and unsheltered single adults (n=100) and about 15% of sheltered and unsheltered adults in families (n=78) cited domestic violence as the reason they left their last permanent residence (Appendix A, Table A2). However, when asked if they had ever been the victim of domestic violence, 45% of sheltered adults in families (n=199), 44% of unsheltered adults in families (n=17), 29% of sheltered single adults (n=613), and 25% of unsheltered single adults (n=178) responded affirmatively (Appendix A, Table A4).

VII. Conclusions/Implications

The CT Counts 2007 estimate for the number of people living in unsheltered conditions appears valid, based on previous enumerations, though direct comparisons are to be Nevertheless, the data suggest that Connecticut has a significant street homelessness problem, particularly in the New Haven, Waterbury, Middletown/Middlesex County, and Balance of State Continuums. Communities may be led to believe that this is a shelter capacity problem. However, they should be cautioned that this is not necessarily the case. First, an analysis in the Balance of State Continuum revealed both available capacity on the night of the count and a significant unsheltered population. Occupancy rates at emergency shelters were 96% for singles programs and 61% for family programs. Second, some unsheltered persons make a choice to avoid shelters and will do so even if more capacity is created. Shelters may be perceived as violating a persons' sense of dignity, or persons may have had direct experiences with the shelters that discourage them from returning. In any case, research has shown that individuals prefer safe-havens and various other "housing first" models and that these methods are more effective in providing stabilization opportunities⁹. Given that such housing options may create more permanent solutions to homelessness, these may represent a better investment strategy than expansions of shelter capacity. But such decisions have to be made in the context of localities' overall strategy for balancing emergency, transitional and permanent housing resources.

The high proportion of disabilities, especially among persons with long-term homelessness and among the street homeless, suggests that supportive housing

⁸ The authors note that 30% of surveyed unsheltered singles and nearly half of surveyed unsheltered families did not proved a response to this question.

For examples of studies that support these claims, see: Tsemberis, Sam, Leyla Gulcur, and Maria Nakae. "Housing First, Consumer Choice, and Harm Reduction for Homeless Individuals With a Dual Diagnosis." *American Journal of Public Health*. 2004. 94:4. pp 651-656.; Kraus, Deborah and Luba Serge. "Innovative Approaches for Providing Services to Homeless People with Concurrent Disorders (Substance Abuse and Mental Illness): A Review of the Literature." *The Social Planning and Research Council of British Columbia*. 2005. http://www.homelessness.gc.ca/research/toolkit/docs/lr_sparcbc_e.pdf.>

models must be a significant part of the solution of reducing homelessness in CT. In fact, an estimated 961 chronically homeless disabled individuals¹⁰ were found in sheltered and unsheltered locations on the night of the count. To address the current need, CT's supportive housing capacity would have to increase. Although new persons will accrue into eligibility as long-term homeless, creation of a sufficient supply should at some point establish enough housing vacancies through unit turnover to accommodate new cases. Further analysis of the population and capacity data gathered through *CT Counts 2007* can be used to update the statewide supportive housing plan (Reaching Home Campaign Plan) and could prove useful to local planning efforts.

Given that the estimate reveals more than one quarter of homeless people are located in areas that are predominantly rural and suburban¹¹, program planners should continue to develop supportive housing units throughout the state and avoid concentration in urban areas alone. To maximize community integration and minimize stigma for supportive housing residents, projects should be consistent with the type and scale of the local housing stock.

For persons in homeless families, the results indicate that most families are not homeless for long periods of time, or not as long as is reported by the single adults. Unlike among the singles, the majority of families do not report having behavioral health problems. Together, these findings suggest that many families can be housed and remain housed with some level of income support. Income supports could vary from relocation grants, to transitional (time-limited) rental assistance, to long-term subsidies. Ideally, supports should be designed to fit the varying profiles of the families, and the varying availability of affordable housing by region in the state. It is a policy matter to determine how to best pay for these supports, including use of federal housing assistance, state housing funds or public assistance grant mechanisms. Varying lengths of assistance can likely be supported by the varying sources, and program planners may choose to allocate those resources accordingly.

Over one half of the families would appear to have no significant disability. At the time of the survey about 44% of families had at least one significant disability. Over the course of a year, it is likely that several times as many families impacted by a disability will experience homelessness (future HMIS data are needed to establish annual prevalence). For families who have disabilities or more intensive support needs, policymakers should consider combining services packages with rental assistance.

In the case of either families with disabilities or without, the number of families who experience homelessness in a year, while significant, may represent a population for

_

¹⁰ Includes disabled single adults and adult members of families who have been continuously homeless for one year or more or have had at least four episodes of homelessness in the past 3 years.

¹¹ Includes areas covered by the Balance of State, Bristol, Litchfield, Middletown/Middlesex, and New Britain Continuums of Care.

whom prevention alternatives could be considered. Particularly given the disruptive impact of homelessness on children and families, thoughtful policy experiments in this area might be considered.

CT's homeless population is largely consistent with the profile of the homeless in the United States. Most are single adults, half of whom have a behavioral health disability and half of whom have been homeless for longer than one year. The singles are also mostly male, and aging. Families are younger, have much lower levels of disability, and are homeless for shorter periods. In both cases, they represent the profiles of the people who are among the neediest in the state – young children and disabled adults. Ending homelessness in CT will require efforts designed to reach these populations and, with sufficient targeting, is within reach. But continuous monitoring and counting will also be required to assure that interventions are working and reducing homelessness in the state.

VIII. Considerations for the Future

As communities across Connecticut begin to plan future collaborative efforts to count sheltered and unsheltered homeless people, the authors offer the following recommendations for building upon the results of *CT Counts 2007*:

Conduct additional analysis of the data currently available. The data gathered through *CT Counts 2007* is a source of valuable information about the scope and dimensions of homelessness in every community throughout the state of Connecticut. Additional data analysis would likely provide important insights that could inform efforts to end homelessness. For example, point-in-time population and program inventory data could be used to project need for housing-based interventions, such as long and short-term rental assistance, transitional housing, and permanent supportive housing. Analysis of occupancy rates at programs throughout the state could help to inform need projections and assessments of whether any programs are currently underused. In addition, analysis of population data by locality could be helpful for local service planning and program development purposes as could an analysis of demographics and special needs among various subpopulations.

Systematically collect information from all stakeholders regarding the challenges and limitations encountered in 2007 and use that information to strengthen the reliability of future estimates. *CT Counts 2007* involved a diverse range of stakeholders, including leaders from local Continuums of Care statewide advocacy organizations, and government agencies; staff from outreach teams, soup kitchens, shelters, hospitals, and housing programs; police and sheriff departments; and community volunteers. Each of these stakeholders can offer valuable insight that can be applied to strengthen the reliability of future estimates.

Allow more time for planning. The authors commend the count sponsors, local count coordinators, non-profits, and volunteers who demonstrated tremendous dedication to coordinating and mobilizing a massive effort in less than four months. With additional time for planning, the authors are confident that future efforts will build upon the success of the 2007 count.

Implement a quality assurance strategy to assess the accuracy of the unsheltered count and determine the proportion of people who are missed.

The authors suggest that the plant-capture and/or next day survey technique be used in the future. The plant-capture method places mock homeless people, also known as "plants" or "decoys", in systematic locations throughout the study area and then tracks how many of the plants are found. The next day survey technique uses visits to programs frequented by homeless people who may not use shelters (e.g. soup kitchens, drop-in centers, and mobile food vans) to gather information about where service recipients stayed on the night of the count and whether that location would have been visible to enumerators. The survey can also gather useful information about locations frequented by homeless people to incorporate in future counts. With both methods, final estimates can be adjusted for the rate of undercounting observed.

Use a consistent time period during which the count is conducted across the state to minimize the likelihood of duplication. Work well in advance of the count with local count coordinators from every region to assess local needs, problem solve local concerns, and develop a commitment to a standardized statewide time period for the count.

Implement a more robust training program for local count coordinators, volunteers, and program staff. Consider offering multiple trainings in locations throughout the state utilizing a standardized curriculum and professional trainers. Consider focusing volunteer recruitment efforts on persons who do not have conflicting responsibilities during the enumeration (providing services, for example), or who may even have social sciences training, such as graduate students in the social sciences.

Pre-test and pre-screen study areas, and field test all forms and survey instruments. Pre-screen study areas before finalizing density ratings and again as close as possible to the actual count to better understand how use patterns change over time and at different hours, to identify hidden areas enumerators might miss, and to clarify confusing area boundaries. Also pre-test a sample of selected study areas during a practice count to help organizers identify and resolve logistical and procedural issues in advance of the actual count. Forms and survey instruments should also be field tested during the practice count.

Consider utilizing web-based technology and dedicated staff to complete sheltered count forms. Use of web-based technology would permit prompts and embedded instructions to assist the user in completing the forms accurately. Web-

based forms should be designed to prevent submission of incomplete or illogical data. Utilization of web-based technology will also reduce data entry errors and eliminate the need to discard illegible data. In addition, competing demands on program staff time may have a negative impact on data quality. In order to minimize the impact, consider recruiting students who, on the night of the count, could be dedicated to ensuring that count forms are completed accurately and submitted promptly. Depending on program size and location, students could be assigned to cover multiple programs. To help ensure data integrity, students should be thoroughly trained and sufficiently compensated.

Translate the survey instruments into Spanish. To avoid biases that can result from spontaneous translations, the survey instruments should be available in Spanish.

Appendix R – Unsheltered Client Tally Sheet

2007 CT PIT Unsheltered Homeless Count Instructions and Tally Sheet

Team Members Names:
Block Group # (appears inside boundary on each map):
Town: New Haven

Instructions:

- Do not count people who are not homeless.
- Your team should attempt to interview every other homeless person you encounter. Use tally marks to count each homeless person your team encounters but does not interview. **Do not include people your team interviews on the tally sheet**.
- Use your best judgment and count each person in only one of the indicated categories.
- Do not wake sleeping individuals.
- For families count both the total # of families you encounter and the total number of adults and children comprising those families.
- At the end of the count, complete totals.
- Submit completed tally sheet and all completed survey forms to (INSERT LOCAL FORMS COLLECTION POINT)

		Single Adults		Families with children under 18 ¹				
# Adult # Adult Males		# Unaccompanied Males Under 18	# Unaccompanied Females Under 18	# Families with children under 18	# Adult Males	# Adult Females	# Males Under 18	# Females Under 18

Family Beds/Units complete both columns ²			Single Adul	t Beds	# Individual			# Overflow		
# Family Units	# Family Beds	# Male	# Female	# Undesignated	Beds	# Family Beds	# Seasonal Beds ³	Beds/Vouchers ⁴		

¹ Do not include minor heads of household in the # of children under 18 years of age.

Program Name:

² For families, count both the beds contained within units and units designated for families (a unit consists of more than one bed). Beds serving families without minor children should be counted as single adult beds. For family facilities offering barrack style accommodations, count only beds.

³ Seasonal Beds are available to individuals or families on a predictable schedule at certain times of the year only.

⁴ Overflow Beds/Vouchers are available to individuals or families at times of peak demand and can include mats/spaces in shelter & payments for hotel stays.
