Connecticut Mastery Test Spring 2007 Results

Hartford Public Schools

July 25, 2007

Executive Summary

Background

The Connecticut Mastery Test (CMT) was first administered in the fall 1986 to students in grades four, six, and eight in the subject areas of Mathematics, Reading, and Writing. A second generation of the CMT was introduced in 1993, and a third generation in 2000. The fourth generation of the CMT, implemented in the spring of 2006, was expanded to include students in grades three, five, and seven. In 2008, students in grades five and eight will also be tested in Science. All students, including English Language Learners and Students with Disabilities, are required to take the CMT.

Over the past three years, performance of students in the Hartford School District has continued to decline, while average overall scores for the State of Connecticut have risen at a rate of approximately 1% per year. Based on these results, Hartford's public education system must implement significant reform measures to close the achievement gap for its students.

The four performance measures for the 2006-2007 school years include third grade reading (early literacy), fourth grade math, fifth grade writing, and seventh grade math. In all four categories, the district assumed that average performance of Hartford students would cease to decline and remain stable for the 2006-2007 school year.

The Hartford School District 2007 Preliminary CMT Results

The 2007 preliminary CMT results coincided with the assumption of level or increased performance in three of the four performance measures: third grade reading (early literacy), fifth grade writing, and seventh grade math. The average performance of Hartford students did not decline for the first time in several years. In addition, the achievement gap between the state and the district begins to narrow in Mathematics and Writing, with several schools showing double-digit gain in the percent of students at or above the proficient level. Reading scores remained stable for third grade, but declined at other grade levels, underscoring the need to implement a reform/redesign strategy.

The three schools that demonstrated the most significant overall gains are Betances, Burr, and Naylor.

Overall School Index (OSI)

What is the Overall School Index (OSI)?

- OSI was developed by the Connecticut State Department of Education with the U.S. Department of Education to comply with Title I requirements.
- OSI was used from 1993 to 2001 to annually rank Title I schools and measure school improvement toward the state goal by focusing on schools rather than individual students.
- OSI takes all student performance into consideration- not only students that meet the state performance goal- but also those student who move from lower performance levels to higher performance levels (increased performance).
- The Hartford Public School District now uses OSI to evaluate schools within the District's School Improvement Matrix.
- The Hartford School Improvement Matrix ranks schools based on their relative performance and annual rate of improvement. Schools fall within four (4) categories that determine their level of autonomy:
 - Autonomous- Relatively high-performing and/or significantly improving schools will be given considerable programmatic autonomy and freedom from bureaucratic operating constraints.
 - 2. Defined Autonomy- Schools in the mid-range of performance will be given autonomy relative to program and operations to build capacity for improvement.
 - Intervention- Chronically low-performing schools that fail to improve will be subject to intervention and will fall under district control.
 - 4. Redesign- Chronically low-performing schools that fall significantly below proficiency standards and fail to improve for two years will be subject to redesign, closure or replacement with higher performing school models.
